This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

THE

NAUTICAL ALMANAC

AND

ASTRONOMICAL EPHEMERIS

FOR THE YEAR

1800.

PUBLISHED BY ORDER OF THE

COMMISSIONERS OF LONGITUDE.

ASTOR LIBRARY
NEW-YORK.

LONDON:

PRINTED BY C. BUCKTON, GREAT PULTENEY STREET;

AND

SOLD BY P. ELMSLY, STRAND, BOOKSELLER TO THE SAID

COMMISSIONERS.

M DCC XCIII.

[Price *Three Shillings and Sixpence.*]

EXTRACT from the ACT of PARLIAMENT concerning the Longitude, made in the Fifth Year of the Reign of His preſent Majeſty.

WHEREAS the Publication of Nautical Almanacs conſtructed by proper Perſons, under the Direction of the ſaid Commiſſioners, would greatly contribute to make the ſaid Lunar Tables more generally uſeful; Be it further Enacted, by the Authority aforeſaid, That it ſhall and may be lawful to and for the ſaid Commiſſioners to cauſe ſuch Nautical Almanacs, or other uſeful Tables, to be conſtructed, and to print, publiſh, and vend, or cauſe to be printed, publiſhed, and vended, any Nautical Almanac or Almanacs, or other uſeful Table or Tables, which they, or the major Part of them, ſhall, from time to time, judge neceſſary and uſeful, in order to facilitate the Method of diſcovering the Longitude at Sea; any Law, Statute, excluſive Privilege, private Charter, or other Cuſtom, to the contrary thereof notwithſtanding.

And be it Enacted, by the Authority aforeſaid, That no Perſon or Perſons ſhall print, publiſh, or vend, or cauſe to be printed, publiſhed, or vended, any Nautical Almanac or Almanacs, or other Table, or Tables conſtructed under the Direction of the ſaid Commiſſioners, without being firſt licenſed by the ſaid Commiſſioners, or the major Part of them: And if any Perſon or Perſons not ſo licenſed, or not being authoriſed by the Perſon or Perſons ſo licenſed by the ſaid Commiſſioners, ſhall print, publiſh, or vend, or cauſe to be printed, publiſhed, or vended, any ſuch Nautical Almanac or Almanacs, or other Table or Tables, every ſuch Perſon or Perſons ſhall, for every Copy of ſuch Nautical Almanac or Table ſo printed, publiſhed, or vended, forfeit and pay the Sum of Twenty Pounds; to be recovered by Action of Debt, Bill, Plaint, or Information, in any of His Majeſty's Courts of Record at *Weſtminſter*; and that One Moiety of ſuch Penalty and Forfeiture ſhall be to His Majeſty, his Heirs and Succeſſors, and the other Moiety to him or them that ſhall proſecute, inform, or ſue for the ſame.

EXTRACT of an Act for the Repeal of all former Acts concerning the Longitude at Sea, except ſo much thereof as relates to the Appointment and Authority of the Commiſſioners thereby conſtituted, and alſo ſuch Clauſes as relate to the conſtructing, printing, publiſhing, vending, and licenſing of Nautical Almanacs and other uſeful Tables; and for the more effectual Encouragement and Reward of ſuch Perſon and Perſons as ſhall diſcover a Method for finding the ſame, or ſhall make uſeful Diſcoveries in Navigation; and for the better making Experiments relating thereto: Made in the Fourteenth Year of the Reign of His preſent Majeſty.

BE it Enacted by the KING's Moſt Excellent Majeſty, by and with the Advice and Conſent of the Lords Spiritual and Temporal, and Commons, in this preſent Parliament aſſembled, and by the Authority of the ſame, That each and every of the ſaid recited Acts (ſave and except ſuch Clauſe and Clauſes in each or any of them as relate to the Appointment or Authority of all or any of the Commiſſioners thereby reſpectively conſtituted, and alſo ſuch Clauſe and Clauſes as relate to the conſtructing, printing, publiſhing, vending, and licenſing of Nautical Almanacs, and other uſeful Tables) ſhall, from and after the Twenty-fourth Day of *June* One thouſand Seven hundred and Seventy-four, be, and are hereby repealed.

And, for a due and ſufficient Encouragement to any Perſon or Perſons who ſhall diſcover any Method or Methods for finding the ſaid Longitude, Be it Enacted by the Authority aforeſaid, That the Firſt Author or Authors, Diſcoverer or Diſcoverers, of each and every ſuch Method or Methods, his or their Executors, Adminiſtrators, or Aſſigns, ſhall be intitled to and have the Rewards or Sums of Money herein-after mentioned; that is to ſay, In caſe the Method propoſed ſhall be, by means of a Time-keeper, the Principles whereof have not hitherto been made public, to the Reward or Sum of Five Thouſand Pounds, if ſuch Method determines the ſaid Longitude to One Degree of a great Circle, or Sixty geographical Miles; to the Reward or Sum of Seven thouſand Five hundred Pounds, if it determines the ſame to Two Thirds of that Diſtance; and to the Reward or Sum of Ten thouſand Pounds, if it determines the ſame to One Half of the ſaid Diſtance: Which reſpective Rewards ſhall be due and paid when ſuch Method ſhall have been ſufficiently tried by the following Experiments and

EXTRACT, &c.

Voyages to be made and performed by ſuch Perſons, and under ſuch Reſtrictions, as the ſaid Commiſſioners for the Diſcovery of Longitude at Sea reſpectively conſtituted by the above-recited Acts, or the major Part of them, ſhall think fit to appoint and direct; (that is to ſay), When and ſo ſoon as Two or more Time-keepers of the ſame Conſtruction ſhall have been tried at the ſame Time, for the Space of Twelve Months, at the Royal Obſervatory at *Greenwich*, then in Two Voyages round the Iſland of *Great Britain*, in contrary Directions, and in ſuch other Voyages to different Climates as the ſaid Commiſſioners ſhall think fit to direct and appoint; and after their Return from ſuch Voyages, or any of them, for ſuch longer Time, at the ſaid Obſervatory, not exceeding Twelve Months, as the ſaid Commiſſioners ſhall judge neceſſary; and alſo when and ſo ſoon as the ſaid Commiſſioners, or Two Thirds of them at the leaſt, ſhall, after ſuch Experiments and Voyages have been made and performed as aforeſaid, have declared and determined that ſuch Method is generally practicable and uſeful, and ſufficiently exact to determine the Longitude at Sea within the Degrees or Limits aforeſaid, in all Voyages for the Space of Six Months, (Impediments from cloudy and hazy Weather excepted); and alſo when and ſo ſoon as the Principles and Practice of ſuch Method are fully diſcovered and explained to the Satisfaction of the ſaid Commiſſioners, or Two Thirds of them at leaſt; and ſuch Author or Authors, Diſcoverer or Diſcoverers, ſhall have delivered up and aſſigned over to the ſaid Commiſſioners, for the Uſe of the Public, the abſolute Property of ſuch Time-keepers as ſhall have been tried by ſuch Experiments and Voyages as aforeſaid, together with all Plates, Deſcriptions, Theories, and Explanations belonging or relating to the ſame, and which ſhall contain the Whole of ſuch Diſcovery of the Longitude; and in caſe the Method propoſed ſhall be by means of improved Solar and Lunar Tables, then and in ſuch Caſe the Author or Authors of ſuch improved Solar and Lunar Tables, their Executors, Adminiſtrators, or Aſſigns, ſhall be intitled to and have the Reward or Sum of Five Thouſand Pounds, if ſuch Solar and Lunar Tables ſhall prove ſufficiently exact to ſhew the Diſtance of the Moon from the Sun and Stars in the Heavens within Fifteen Seconds of a Degree, anſwering to about Seven Minutes of Longitude, after making an allowance of Half a Degree for the Errors of Obſervation; and when it ſhall appear to the Satisfaction of the ſaid Commiſſioners, or Two Thirds of them at leaſt, that ſuch Tables are conſtructed intirely upon the Principles of Gravitation laid down by Sir *Iſaac Newton* (except with reſpect to thoſe Elements which muſt neceſſarily be taken from aſtronomical Obſervations), and alſo when the Truth of ſuch Tables ſhall have been further confirmed and proved by Compariſon with a Series of aſtronomical Obſervations made during a Period of Eighteen Years and a Half, which is deemed the Period of the Irregularities of the Lunar Motions; which Reward ſhall be due and paid, when the ſaid Commiſſioners, or two Thirds of them at leaſt, ſhall have declared

and determined, that ſuch Tables are ſufficiently exact to ſhew the Diſtance of the Moon from the Sun and Stars in the Heavens, within the limits above-mentioned; and alſo when the Author or Authors of ſuch improved Solar and Lunar Tables, his or their Executors, Adminiſtrators, or Aſſigns, ſhall have delivered up and aſſigned over to the ſaid Commiſſioners, for the Uſe of the Public, the abſolute Right and Property to and in the ſame, together with the Theory relating thereunto; and in caſe any other Method ſhall be propoſed for finding the Longitude at Sea beſides thoſe before-mentioned, that then and in ſuch Caſe the Firſt Author or Authors, Diſcoverer or Diſcoverers, of any ſuch Method, his or their Executors, Adminiſtrators, or Aſſigns, ſhall be intitled to and have the Reward or Sum of Five Thouſand Pounds, if it ſhall determine the ſaid Longitude within One Degree of a great Circle or Sixty geographical miles; to the Reward or Sum of Seven thouſand Five hundred Pounds, if it ſhall determine the ſame to Two Thirds of that Diſtance; and to the Reward or Sum of Ten thouſand Pounds, if it ſhall determine the ſame to One Half of the ſame Diſtance; which reſpective Rewards ſhall be due and paid, ſo ſoon as the ſaid Commiſſioners, or Two Thirds of them at leaſt, ſhall, after proper Trial have been made by their Appointment and Direction, have determined that ſuch Method ſhall be generally practicable and uſeful for finding the Longitude at Sea within the reſpective limits above-mentioned.

And be it further Enacted, by the Authority aforeſaid, That when and ſo ſoon as any ſuch Method or Methods, for the Diſcovery of the ſaid Longitude, ſhall be tried, as before-mentioned, and found practicable and uſeful at Sea, and ſufficiently exact to determine the Longitude within any of the Degrees or Limits aforeſaid, the ſaid Commiſſioners, or Two Thirds of them, ſhall certify the ſame, under their Hands and Seals, to the Commiſſioners of the Navy for the Time being, together with the Name or Names of the Perſon or Perſons who ſhall be the Author or Authors of ſuch Method or Methods; and upon the Receipt of ſuch Certificate, the ſaid Commiſſioners of the Navy are hereby authoriſed and required to make out a Bill or Bills upon the Treaſurer of the Navy for the reſpective Sum or Sums of Money to which the Author or Authors of ſuch Propoſal, his or their Executors, Adminiſtrators, or Aſſigns, ſhall be intitled by virtue of this Act; which Sum or Sums the ſaid Treaſurer is hereby required to pay to the ſaid Author or Authors, their Executors, Adminiſtrators, or Aſſigns accordingly, out of any Money that may be in his Hands unapplied to the Uſe of the Navy, according to the true Intent and Meaning of this Act.

And be it further Enacted, by the Authority aforeſaid, That the ſaid Commiſſioners for the Diſcovery of Longitude at Sea, or any Five or more of them, ſhall have full Power and Authority to hear and receive any Propoſal or Propoſals that ſhall be made to them

for diſcovering the ſaid Longitude, or for making any other uſeful Improvement in Navigation; and in caſe the ſaid Commiſſioners, or any Five or more of them, ſhall be ſo far ſatisfied of the Probability of any ſuch Diſcovery or Improvement as to think it proper to cauſe Experiments to be made thereof, they ſhall certify the ſame, together with the Names of the Author or Authors of ſuch Propoſal or Propoſals, under their Hands and Seals, to the Commiſſioners of the Navy, who are hereby authoriſed and required to make out a Bill or Bills upon the Treaſurer of the Navy for any Sum or Sums of Money as the ſaid Commiſſioners for the Diſcovery of Longitude at Sea, or any Five or more of them, ſhall think neceſſary for making ſuch Experiments; which Sum or Sums the Treaſurer of the Navy is hereby required to pay immediately to ſuch Perſon or Perſons as ſhall be appointed by the ſaid Commiſſioners to make thoſe Experiments out of any Money which ſhall be in his the ſaid Treaſurer's Hands unapplied as aforeſaid,

And be it further Enacted, by the Authority aforeſaid, That if any Perſon or Perſons ſhall make any Diſcovery for finding the Longitude at Sea, which, though not of ſo great Uſe as to be intitled to any of the great Rewards above ſpecified, ſhall nevertheleſs be adjudged by the ſaid Commiſſioners for the Diſcovery of Longitude at Sea, or the major Part of them, to be of conſiderable Uſe to the Public, or ſhall make any other Diſcovery or Diſcoveries, Improvement or Improvements, uſeful to Navigation; then, and in ſuch Caſe, ſuch Perſon or Perſons, his or their Executors, Adminiſtrators, or Aſſigns, ſhall, from time to time, have and receive ſuch leſs Reward or Sum or Sums of Money as the ſaid Commiſſioners, or the major Part of them, ſhall think reaſonable; and certify accordingly, under their Hands and Seals, to the Commiſſioners of the Navy, who are hereby authoriſed and required to make out a Bill or Bills upon the Treaſurer of the Navy for any ſuch Sum or Sums of Money, which the ſaid Treaſurer is hereby authorized and required to pay immediately to ſuch Perſon or Perſons, his or their Executors, Adminiſtrators, or Aſſigns, out of any Money that ſhall be in his the ſaid Treaſurer's Hands unapplied as aforeſaid.

Provided alſo, and it is hereby further Enacted, That in caſe any Perſon or Perſons who ſhall and may have received any Sum or Sums of Money, by virtue of this Act, as a Reward for any Method of diſcovering the Longitude at Sea, ſhall afterwards become intitled to any of the greater Rewards appointed by this Act, for or on account of the ſame Method; that then, and in ſuch Caſe, ſuch Sum or Sums of Money as they ſhall or may have received as aforeſaid ſhall be conſidered as Part of ſuch greater Reward, and deducted therefrom accordingly; and that no Perſon ſhall receive more in the Whole for any One Method for diſcovering the Longitude at Sea than the greateſt Reward appointed for ſuch Method by the Act.

By the COMMISSIONERS appointed by Acts of Parliament for the Diſcovery of the Longitude at Sea; and for examining, trying, and judging of all Propoſals, Experiments, and Improvements relating to the ſame.

WHEREAS we think fit to employ you to print the Nautical Almanacs and Aſtronomical Ephemerides for the Years 1796, 1797, 1798, 1799, and 1800; We do, in purſuance of the power veſted in us by Acts of Parliament, hereby licenſe, authorize and impower you to print the Nautical Almanacs and Aſtronomical Ephemerides for thoſe Years accordingly, together with ſuch other uſeful Tables for facilitating the method of diſcovering the Longitude at Sea as have been conſtructed under our direction, and will be delivered to you by the Rev. Dr. NEVIL MASKELYNE, His Majeſty's Aſtronomer Royal, at *Greenwich*; and for ſo doing this ſhall be your ſufficient Warrant. Given under our Hands and Seals the 12th Day of *July*, 1788.

PREFACE.

THE Commiſſioners of Longitude, in Purſuance of the Powers veſted in them by Act of Parliament, preſent the Public with the NAUTICAL ALMANAC and ASTRONOMICAL EPHEMERIS for the Year 1800, being the Thirty-fourth Impreſſion, to be continued annually; a Work which muſt greatly contribute to the Improvement of Aſtronomy, Geography, and Navigation. This EPHEMERIS contains every Thing eſſential to general Uſe that is to be found in any Ephemeris hitherto publiſhed, with many other uſeful and intereſting Particulars never yet offered to the Public in any Work of this Kind. The Tables of the Moon had been brought by the late Profeſſor MAYER, of *Gottingen*, to a ſufficient Exactneſs to determine the Longitude at Sea, within a Degree, as appeared by the Trials of ſeveral Perſons who made Uſe of them. The Difficulty and Length of the neceſſary Calculations ſeemed the only Obſtacles to hinder them from becoming of general Uſe: To remove which this EPHEMERIS was made; the Mariner being hereby relieved from the Neceſſity of calculating the Moon's Place from the Tables, and afterwards computing the Diſtance to Seconds by Logarithms, which are the principal and only very delicate Part of the Calculation; ſo that the finding the Longitude by the Help of the EPHEMERIS is now in a Manner reduced to the Computation of the Time, an Operation equal to that of an Azimuth, and the Correction of the Diſtance on Account of Refraction and Parallax, which is alſo rendered very eaſy by either of the Two Methods invented by Mr. LYONS and Mr. DUNTHORNE, and publiſhed in the Firſt Edition of the Tables requiſite to be uſed with the EPHEMERIS, and ſince, with Improvements, in the Second Edition of the ſame Tables; or by either of the Two Methods annexed to the EPHEMERIS of 1772, being both Improvements of the Method which I formerly publiſhed in the BRITISH MARINER'S GUIDE and PHILOSOPHICAL TRANSACTIONS, the Firſt by myſelf, and the Second by Mr. GEORGE WITCHELL, which are now alſo annexed to the Second Edition of the REQUISITE TABLES; but ſtill more ſo by the GENERAL TABLES for correcting the apparent Diſtance of the Moon and a Star or the Sun from the Effects of Refraction and Parallax, computed at great Expence by Order of the Commiſſioners of Longitude, and publiſhed under the Care of Dr. SHEPHERD, Plumian Profeſſor of Aſtronomy and Experimental Philoſophy at CAMBRIDGE, in 1772.

MAYER's laſt Manuſcript Tables of the Sun and Moon, and his curious and elaborate Theory of the Moon, were received by the

Board of Longitude, after his deceaſe, for which his Widow received a Reward of Three Thouſand Pounds, by Act of Parliament, and the celebrated Mr. LEONARD EULER the Sum of Three Hundred Pounds for having furniſhed the Theorems made Uſe of by Mr. MAYER in his Theory. Both the Tables and Theory were printed under my Inſpection, and publiſhed in 1770.

The Sun's Longitude, and every Thing relating thereto, has been always inſerted in the NAUTICAL ALMANAC, as computed from theſe Tables, from its firſt Beginning in 1767 to the preſent Time. The Moon's Place in the Heavens was inſerted as calculated directly from MAYER's TABLES, in the NAUTICAL ALMANAC, from 1767 to 1776 incluſive, or the firſt ten Years. But from the NAUTICAL ALMANAC of 1777 to that of 1788, both incluſive, or the next twelve Years, the Moon's Place was inſerted, as calculated from new Tables, improved from MAYER's Tables, compoſed by Mr. CHARLES MASON, under my Direction, from Calculations made by Order of the Board of Longitude upon the Series of lunar Obſervations made by the late Dr. BRADLEY, and publiſhed in the NAUTICAL ALMANAC of 1774; in which new Tables the Epoch of the Moon's mean Longitude is 1″ leſs, that of the Apogee is 56″ leſs, and that of the aſcending Node 45″ more than in MAYER's printed Tables, and the Equations are calculated to Tenths of a Second; and moreover one new Equation is introduced, whoſe Argument is the mean Diſtance of the Moon from the Sun's Apogee, and Maximum is 16″,4. Theſe Tables compared with the above-mentioned Series of Obſervations, a proper Allowance being made for the unavoidable Error of Obſervation, ſeemed to give always the Moon's Longitude in the Heavens correctly within 45″ of a Degree. But from the NAUTICAL ALMANAC of 1789 to that of 1796, both incluſive, the Moon's Place was inſerted as calculated from new Tables ſtill farther corrected by Mr MASON, entitled by him TABLES of 1780, as having been completed about that Time, being rendered more exact than the former by the Addition of eight Equations to the Number in MAYER's Tables, taken from MAYER's Theory as to the Arguments, but ſettled as to the Maxima, from the ſaid Obſervations, and the Whole being calculated to Tenths of a Second. Theſe laſt new Tables when compared with 177 of the above-mentioned Series of Obſervations, being all in the Whole Series in which certain Tables compoſed by Mr. MASON called Tables of 1778, but leſs exact than thoſe of 1780, differed above 20″ from the Obſervations, ſeemed, after making a proper Allowance for the unavoidable Error of Obſervation, to give always the Moon's Longitude in the Heavens correct within 30 Seconds of a Degree. At the ſame Time the Error of theſe Tables in Latitude ſeemed never to exceed a Minute, which will but triflingly affect the computed Diſtances of the Moon from the Sun and zodiacal Stars ſet down in the EPHEMERIS. It may be proper, however, here to

obſerve, that the 18th Equation of theſe Tables, whoſe Argument is the mean Longitude of the Moon's aſcending Node, or the ſame with that of the laſt Equation, or that of the Equinoctial Points, has been omitted deſignedly in the Calculations of the EPHEMERIS, as it does not yet ſufficiently appear that ſuch an Equation ſhould ariſe from the Theory of Gravity, and the Series of Dr. BRADLEY's Obſervations affords too ſhort a Period to ſtate a Point of ſuch Delicacy as this Equation of not quite 8″ from a ſemi-period only of its Variations.

I ſhall now offer ſome Remarks on Mr. MAYER's mean Motions of the Sun and Moon, thoſe of the Moon being taken the ſame in Mr. MASON's Tables, and propoſe a ſmall Correction of them, as well as of the Longitudes and Latitudes of the fixt Stars.

Mr. MAYER's Tables of the Sun having been ſettled from M. DE LA CAILLE's Obſervations and his own, made between the Years 1750 and 1760, may be ſuppoſed to give the Epochs of the mean Places of the Sun pretty exact for that Time. And Mr. MASON's Tables of 1780 having been ſettled from Dr. BRADLEY's Obſervations, made alſo between 1750 and 1760, may be ſuppoſed to give the Epochs of the mean Places of the Moon pretty exact for that time. But the Rates of the Sun's and Moon's mean Motions for whole Years or Centuries in the ſame Tables may require ſome Correction for the Reaſons which I am now to adduce. MAYER, in the Conſtruction of his Tables, aſſumed the Preceſſion of the Equinoxes, or the annual Motions of the fixt Stars in Longitude, to be exactly 50″,3, without paying any Regard to the Alteration of the Place of the Equinox ariſing from the Tranſlation of the Plane of the Ecliptic by the Action of the Planets. Dr. BRADLEY, by comparing his own Obſervations of Declinations of Stars lying on both Sides of the Equinoctial Colure with the like Obſervations of TYCHO BRAHE, had found the Preceſſion of the Equinoxes in Longitude to be exactly 1° in 71¼ Years, or at the Rate of 50″, 35 in a Year, which is evidently what ariſes from the Motion of the Plane of the Equator alone, being occaſioned by the Actions of the Sun and Moon upon the ſpheroidical Figure of the Earth. But the Equinoctial Point is alſo altered, though in a far leſs Degree, by the continual Motion of the Plane of the Ecliptic, owing to the Action of the Planets, and goes forward 0″,15 in a Year from that Cauſe along the Ecliptic, which will diminiſh the Preceſſion of the Equinoxes, or the apparent annual Motions of the fixt Stars, lying near the Plane of the Ecliptic, in Longitude as much, and reduce them from 50″, 35 to 50″,20, which is 0″,10 leſs than aſſumed in MAYER's Tables; for as to thoſe which have any conſiderable Latitude, their Longitudes will be further affected by a ſecular Variation relative both to their Longitude and Latitude, as expreſſed in the 44th Table annexed to the 1ſt Vo-

lume of my Obſervations made at the Royal Obſervatory, being derived from the ſame Cauſe, the Motion of the Plane of the Ecliptic produced by the Action of the Planets, and its being performed upon an Axis not very remote from the Line of the Equinoxes. It is obvious that the ſame Cauſe will alſo affect the apparent Latitudes of the fixt Stars. Now MAYER having ſettled the mean Motions of the Sun and Moon from the Equinoxes, by Compariſon of Obſervations made in his Time with thoſe made by Aſtronomers in former Ages, and particularly by Mr. FLAMSTEAD 60 Years before him, aſſuming the annual Preceſſion of the Equinoxes to be 50″,3 or 0″,1 too great, and MAYER's mean Motions of the Moon having been adopted in Mr. MASON's Tables, therefore the annual mean Motions of the Sun and Moon from the Equinox in MAYER's Tables, and the Moon's mean Motions in Mr. MASON's Tables are too great by 0″,10 in a Year, and muſt be diminiſhed accordingly, or at the Rate of 10″ in a Hundred Years; agreeable to Schol. 3, Prob. 3, of the Explanation and Uſe of MAYER's Solar and Lunar Tables; where he inſiſts that their mean Motions are rightly ſettled from Obſervations, or very nearly ſo, with reſpect to the fixed Stars; but if it ſhould be thought proper to ſtate the Preceſſion of the Equinox ſlower or quicker than 50″,3 in a Year, the mean Motions of the Sun and Moon ſhould be all made ſlower or quicker by the ſame Quantity.

Hence as the Obſervations by which Mr. MAYER ſettled the Epochs of his ſolar Tables, and by which Mr. MASON ſettled the Epochs of his lunar Tables of 1780, were made about the Year 1756 at a Medium, the Correction of 0″,10 in a Year, above directed to be made to the Moon's Motions, ſhould be dated from that Period; or there ſhould be ſubſtracted at the Rate of 1″ in 10 Years from the Epochs after 1756, and be added at the ſame Rate to the Epochs before 1756, in Mr. MAYER's and Mr. MASON's Tables.

The Longitudes of the Stars of Dr. BRADLEY's Catalogue, inſerted in the NAUTICAL ALMANAC of 1773, having been likewiſe ſettled from his Obſervations made about the Year 1756, and carried on to the Year 1760 by the annual Preceſſion 50″.35, ſhould be firſt reduced back to the Beginning of 1756 by the ſame annual Preceſſion 50″,35 which he uſed, and then carried forward to any future Period, or backward to any preceding one, by the true annual Preceſſion of the Equinoxes 50″,20 for every Year following or preceding 1756, and further corrected by the Equation of the ſecular Motion derived from my 44th Table. The Latitudes of the fixt Stars contained in the ſame Catalogue ſhould alſo be corrected by the ſecular Equation derived from my 45th Table, according to the Number of the Years before or after 1756.

In the Interval of 41 Years, which have elapſed ſince 1756, to the Year 1797, theſe Corrections having amounted to 4″,1 in the

Epochs of Longitude of the Sun and Moon, and to 13″ in the Longitude of ſome of the Stars from which the Moon's Diſtances are computed in the EPHEMERIS, and to 20″ in ſome of their Latitudes, it has been thought proper to allow for them: Therefore the Sun's Place in this EPHEMERIS and the ſucceeding ones will be found computed from MAYER's Tables, and the Moon's Place from Mr. MASON's Tables of 1780, both corrected in the Manner above-mentioned, and the Diſtances of the Moon from the Stars will be found computed from their Longitudes, carried on and corrected as above-mentioned; their Latitudes too ſhould have been taken according to the Corrections above-mentioned, but the general Tables of Moon's Diſtances from the particular Stars having been made Uſe of as far as the EPHEMERIS of 1802 incluſive, in which the Latitudes of the Stars have been taken which belong to the Year 1780, thoſe Corrections could not be applied; the Error reſulting, however, will be very trifling. But in the EPHEMERIS of 1803 the Latitudes as well as Longitudes of the Stars are propoſed to be thoroughly corrected; and the Moon's Diſtances from them computed by the late Mr. TAYLOR's accurate Tables of Logarithmic Sines and Tangents to every Second of the Quadrant.

To illuſtrate theſe Corrections by Examples:—Let it be required to find the Sun's mean Longitude and that of his Apogee, by MAYER's Tables; and the Moon's mean Longitude, and mean Anomaly, and the mean Longitude of her Node; and the mean Longitude and Latitude of Fomalhaut, all to the Beginning of 1797. The Sun's mean Longitude will be 9ˢ. 10°. 37′. 28″, 6, and the Longitude of his Apogee 3ˢ. 9°. 29′. 11″, 9. The Moon's mean Longitude 10ˢ. 7°. 34′ 30″, 7, and with Acceleration 10ˢ. 7°. 34′. 39″, 2. Her mean Anomaly 0ˢ. 24°. 6′. 53″, and with Acceleration 0ˢ. 24°. 7′. 1″, 5 and the Longitude of her Node, 3ˢ. 1°. 15′. 1″, 9. The Longitude of Fomalhaut, 11ˢ. 0°. 59′. 58″, 9 and its Latitude, 21°. 6′. 35″, 0 South; its Variation of Longitude in 100 Years different from the mean Preceſſion, at the Rate of 50″, 20 in a Year, by Table 44 being + 17″, 3 and its Variation of Latitude in the ſame Time by Table 45, being + 17″, 2.

The Calculations of the Planets Places have been made for this EPHEMERIS from M. DE LA LANDE's Tables contained in the Second Edition of his Aſtronomy, as they have been for every EPHEMERIS beginning with that of 1780; and thoſe of the Eclipſes of Jupiter's Satellites made from Mr. WARGENTIN's Tables annexed to the ſame Tables of M. DE LA LANDE, excepting the Eclipſes of Jupiter's Second Satellite, which are inſerted in this EPHEMERIS for the Nineteenth Time from new Tables tranſmitted to me from their learned Author, the late Mr. WARGENTIN, Secretary to the Royal Academy of Sciences at STOCKHOLM, and publiſhed at the End of the Nautical Almanac of 1779.

PREFACE.

All the Articles of the EPHEMERIS were computed by two ſeparate Perſons, and examined by a third, except the Moon's Longitude, Latitude, Right Aſcenſion, Declination, Semidiameter, and Parallax, which for Noon were computed by one Perſon, and for Midnight by another, and the Truth of theſe Calculations aſcertained by Means of Differences, which for the Moon's Longitude were carried as far as the Fourth Order.

NEVIL MASKELYNE,
ASTRONOMER ROYAL.

GREENWICH,
Dec. 2, 1791.

EXPLANATION OF THE CHARACTERS USED IN THE ASTRONOMICAL EPHEMERIS.

The PLANETS, *&c.*

☉ The Sun.	♂ Mars.
☽ The Moon.	♃ Jupiter.
☿ Mercury.	♄ Saturn.
♀ Venus.	♅ Georgian.
⊖ The Earth.	

☊ The Moon's, or any other Planet's Aſcending Node.
☋ The Deſcending Node.
☌ Conjunction, or Planets ſituated in the ſame Longitude.
□ Quadrature, or Planets ſituated in Longitudes differing 3 Signs from each other.
☍ Oppoſition, or Planets ſituated in oppoſite Longitudes, or differing 6 Signs from each other.

N. North.	Inf. Inferior.	Im. Immerſion.
S. South.	Sup. Superior.	Em. Emerſion.

SIGNS of the ZODIAC.

S.		S.	
0	♈ Aries.	6	♎ Libra
1	♉ Taurus.	7	♏ Scorpio.
2	♊ Gemini.	8	♐ Sagittarius.
3	♋ Cancer.	9	♑ Capricornus.
4	♌ Leo.	10	♒ Aquarius.
5	♍ Virgo.	11	♓ Piſces.

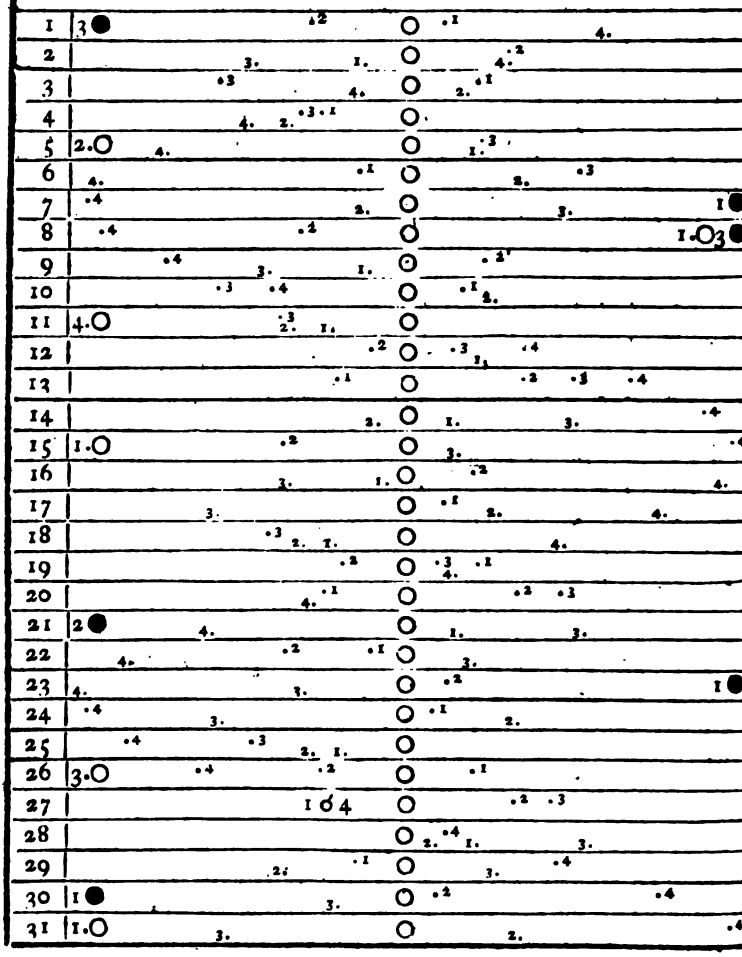
CONFIGURATIONS of the SATELLITES of JUPITER at XI o'Clock at *Night*.



TABLES

TO

IMPROVE AND RENDER MORE GENERAL

THE

METHOD OF FINDING THE LATITUDE,

BY OBSERVING TWO ALTITUDES OF THE SUN,

AND THE INTERVAL OF TIME BETWEEN.

BY JOHN BRINKLEY, *A. M.*

ANDREW'S PROFESSOR OF ASTRONOMY, *DUBLIN*;

LATE FELLOW OF CAIUS COLLEGE, *CAMBRIDGE*.

PUBLISHED BY ORDER

OF THE

COMMISSIONERS OF LONGITUDE.

1794.

A GENERAL REMARK,

SHEWING WHEN THE FOLLOWING

TABLES

ARE TO BE USED.

BY THE ASTRONOMER ROYAL.

IF the Latitude computed by the Rules given in the *Requiſite Tables*, under the Reſtrictions in the Remarks at the End of the Examples, differs leſs than five Minutes from the Latitude by Account, it will be within a Minute of the true Latitude, and therefore no further Operation will be neceſſary. If the computed Latitude differs five Minutes or more from the Latitude by Account, the following Tables are here propoſed to be uſed, inſtead of repeating the Operation by the *Requiſite Tables*, as being more conciſe, but particularly as bringing out a true Reſult when the common Method fails, from the computed Latitude found by repeated Operations not approaching nearer and nearer, or, as it is commonly called, not converging to the true Latitude, or not ſufficiently faſt; which cannot be known till after the trouble of going through thoſe Operations.

THE LATITUDE may generally be found from obſerving two ALTITUDES of the SUN and the INTERVAL OF TIME between, by one Operation, as is directed in the *Requiſite Tables*, with the Aſſiſtance of the following Tables: but it is to be obſerved, that the Argument of Table I. is the true Latitude, and as only the Latitude by Account and the computed Latitude are known, there will be a Source of Error from this Cauſe when the Declination and Latitude are nearly equal and of the ſame Name; however, the Error ſo ariſing, may in moſt Caſes be corrected by the Directions hereafter given. This Method ought not to be depended on when the Latitude by Account and Declination of the ſame Name are ſo nearly equal that it is uncertain whether the true Latitude is greater or leſs than the Declination. There is alſo another Caſe in which the Method cannot be applied, taken Notice of in the Rules. In conſtructing the 2d and 3d Tables, regard has been paid to the proper Interval of Time between the Obſervations neceſſary to prevent the Latitude being too much affected by the Errors of the Obſervations and of the going of the Watch. The Limit of the Interval is ſuppoſed ſuch as is directed by the Rules in Dr. MASKELYNE's *Britiſh Mariner's Guide*, and in the *Requiſite Tables*; which Rules are deduced from two Theorems given in the *Britiſh Mariner's Guide*. Perhaps in the preſent improved State of Sextants and Watches, the Limit may be ſomewhat extended.

The ſecond Table is not calculated beyond ſix Hours from the Meridian. When the Latitude and Declination are of the ſame Name, and both leſs than 4 or 5 Degrees, ſmall Errors in the Altitudes and Interval will cauſe a very great Error in the Latitude, unleſs the Obſervations are made very near Noon, therefore in ſuch Caſes the Latitude found cannot be depended on: But this Defect muſt be common to all Methods.

TABLE I.

The Argument on the Top is the Degree of the Declination, and that on the Side is the Degree of Latitude.

The Sum or Difference of the Number found by this Table and Unity muſt be taken. The Sum to be uſed when the Declination, and Latitude are of different Denominations and the Difference when of the ſame.

Divide the Sum or Difference found by Table I. by the Number from Table II. or III.

USE OF THE TABLES.

WITH the Latitude by Account compute the Latitude once, as directed in the *Requiſite Tables*.

I. If the Obſervations are on the ſame Side of Noon.

When the Declination is greater than the Latitude and of the ſame Denomination; the Latitude by Account and that computed will be on the ſame Side of the true Latitude.

When the Latitude and Declination are of different Denominations, or when the Latitude is greater than the Declination, the Latitude computed and that by Account will be on different Sides of the true Latitude.

II. If the Obſervations are on different Sides of Noon, juſt the contrary will take place.

Take the Sum or Difference of the Number found by Table I. and Unity, according as the Latitude and Declination are of a Different or the ſame Denomination.

Divide this Sum or Difference by the Number taken from Table II. or III. Increaſe or diminiſh the *Quotient by Unity according as the true Latitude is or is not between the Latitude by Account and that computed.

Laſtly divide the Difference between the Latitude by Account and that computed by the above Quotient ſo increaſed or diminiſhed, and the Reſult will be the Correction to be applied to the Latitude computed.

OBSERVATION I. When the Latitude and Declination are nearly equal, it will be proper to correct the Latitude twice: This is done by uſing the Latitude once corrected for the Argument of Table I. inſtead of the Latitude computed.

OBSERVATION II. When the Latitude computed is farther from the true Latitude than the Latitude by Account is: It is poſſible that the corrected Latitude may differ ſeveral Minutes from the Truth, if the Latitude by Account be far from the Truth. In ſuch caſe uſe the Latitude corrected as the Latitude by Account and repeat the whole Operation.

OBSERVATION III. In the particular Caſe, when the Latitude per Account and that computed are on the ſame Side of the true Latitude, and the Quotient mentioned in the Rule happens to be nearly equal to Unity, this Method cannot be depended on.

* *N. B.* According as this Quotient is greater or leſs than Unity, the Latitude computed will or will not be nearer the true Latitude than the Latitude by Account is.

EXAMPLE

EXAMPLE I.

A. M. greater Alt. 50°. 1′,2 } 1h. 30′. Star's declin. 14° N.
A. M. leſs Altitude 41 . 33 ,2 } Interval Lat. by Acc. 52°. 5′ N.
Lat. computed 52°. 5′¾ Middle Time 1h. 46′,7
Time neareſt Noon 1 . 1 ,7

By the Rule the true Latitude is between the Latitude by Account and that computed.
Table I. gives ,2 Table II. gives ,09

Difference $\frac{1}{,8}$

$\frac{,8}{,09} = 9$

Add 1

Sum 10

Lat. by Account 52°. 5′
Lat. computed 52 . 5
Difference 44

$\frac{44\frac{1}{4}}{10} = 4',4$ Correction of Lat.
52. 5,7 Lat. computed.
52. 10,1

N. B. True Latitude is 52°. 10′.
Times of Obſerv. $\left.\begin{matrix} 9^h.\ 30'. \\ 11\ .\ 0. \end{matrix}\right\}$ A. M.

EXAMPLE II.

A. M. Altitude 50°. 1′,2 } 3h. 30′. Lat. by Acc. 51°. 30′ N.
P. M. Altitude 41 . 33 ,2 } Interval Declination 14 N.

By the Rule the true Latitude is not between the Latitude by Account and that computed.
Lat. computed 52°. 5′,2 Middle Time 0h. 44¼ Tab. I. gives ,2
Lat. by Account 51 . 30 T. neareſt Noon 1 . 0¼ 1

Difference 35,2

$\frac{35,2}{9} = 3',9$ Corrn. of Latitude.
52. 5,2
52. 9,1 Latitude corrected.

Difference 0,8
Tab. III. gives ,08

$\frac{0,8}{,08} = 10$
Subtract 1
Diff. 9

EXAMPLE III.

M. Altitude 70°, 1′ } Interval Lat. by Account 6°. 30′ N.
M. Altitude 35 . 21 } 2h. 20′. Declination 5 . 30 N.

By the Rule the true Latitude is between the Latitude by count and that computed.

. computed 8°. 16′ Middle Time 2h. 29′½ Tab. I. gives ,66
. by Account 6 . 30 T. nearest Noon 1 . 19 ½ 1

ference 1 . 46 = 106′ Difference ,34
Tab. II. gives ,20

$\frac{,34}{,2} = 1,7$

Add 1

Sum 2,7 $\frac{106'}{2,7} = 40'$ Correction of Lat.

8.16

7.36 Lat. once corrected.

ince in this Example the Declination and Latitude are nearly al, the Latitude ought to be twice corrected.

. I. entered with Lat. 7°. 36′ gives ,74
1,00
ference — — 0,26 $\frac{,26}{,2} = 1,3$

Add 1

Sum 2,3

- = 46′ Correction of Latitude.
8. 16

7. 30 Latitude twice corrected.

I. B. The true Latitude is 7°. 30′, and it would have required n Operations by the common Method to have had the Lati- within 10′ of the Truth.

EXAMPLE IV.

M. Altitude 75°. 8′,6 } Interval Lat. by Account 10°. 10′ N.
M. Altitude 42 . 31,6 } 4h. 15′. Declination 11. 0 N.

y the Rule the true Latitude is between the Latitude by ount and that computed.

Lat. computed 8°. 52′ Mid. T. 1ʰ. 6′,7 T. neareſt N. 0ʰ. 59′,8
Lat. by Acc. 10 . 10 Table I. gives 1, 24 Tab. III. gives, 11

1 . 18 = 78′ Difference 0, 24

$\frac{,24}{,11} = 2,2$ Add 1

3,2

$\frac{78'}{3,2} = 24'$ correction of Lat.

8. 52

9. 16 Lat. once corrected.

With Argum. of Lat. 9°. 16′ T. I. gives 1, 19

Difference $\frac{1}{,19}$ $\frac{,19}{,11} = 1,7$

1

2,7

$\frac{78'}{2,7} = 28'$ Corrⁿ. of Latitude

8. 52
28

9. 20 Latitude corrected.

N. B. True Latitude is the ſame.

EXAMPLE V.

A. M. Altitude 5°. 36′,1 } Interval 3ʰ Sun's Declination 12°N.
A. M. Altitude 45 . 5,7 } Lat. by Account 27 N.

The true Latitude is between the Latitude computed and that by Account.

Lat. computed 30°. 5′ Middle T. 4ʰ. 25′ Table I. gives ,37
Lat. by Acc. 27 T. neareſt N. 2 . 55 1

3 . 5 = 185′ Difference 0, 63
Table II. gives 1, 41

$\frac{,63}{1,41} = ,45$

Add 1

Sum 1,45

$\frac{185'}{1,45} = 128' = 2°.8'$ corrᵒ. of Lat.

30. 5

27, 57 Lat. corrected.

In this Example the Latitude computed is twice as far from the Truth as the Latitude by Account is; and the Latitude by Account is nearly a Degree from the Latitude computed, the Operation ought therefore to be repeated uſing the laſt-found Latitude as the Latitude by Account.

The Lat. recomputed is	28°. 7′½	$\frac{10'\frac{1}{2}}{1,45} = 7'\frac{1}{2}$	28°. 7′½	Lat. by Acc.
Latitude by Account	27 . 57		7 ½	Correction.
Difference	10½		28 . 0	Lat. corrd.

N. B. The true Latitude is 28°. 0′. and the Times of Obſervation 6h. A. M. and 9h. A. M.

The Tables are calculated, and the Rules deduced from the following Formulas:

Let L = true Latitude, D = the Declination, T = the Time neareſt Noon, and M = the Middle Time.

Put $m = 1 \underset{\sim}{+} \frac{t,D}{t,L}$

$\frac{}{s,T \times t,M - vs,T}$, When both Obſervations are on the ſame Side of Noon.

$m = 1 \underset{\sim}{+} \frac{t,D}{t,L}$

$\frac{}{s,T \times t,M + vs,T}$, When the Obſervations are on different Sides of Noon.

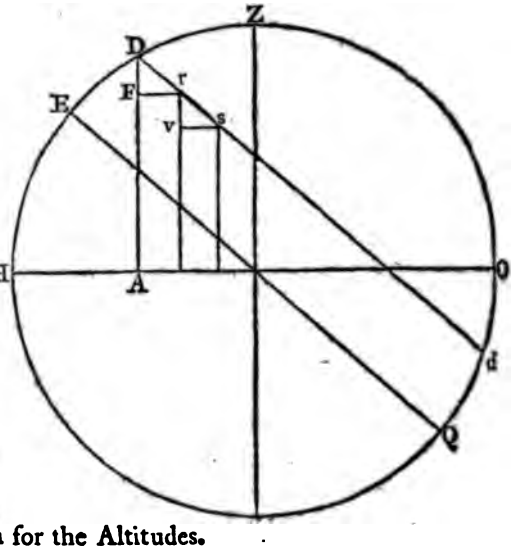
The Sign + to be uſed when the Declination and Latitude are of different Denominations, and ∼ when of the ſame: then the Error in the computed Latitude = the Difference between the computed Latitude and Latitude by Account divided by m ± 1;

viz. by m + 1 { Obſervations on the ſame Side of Noon, and Latitude greater than the Declination or of a diff. Denomina.
Obſervations on different Sides of Noon, and Latitude leſs than the Declination and of the ſame Denomin.

viz. by m − 1 { Obſervations on ſame Side of Noon, and Latitude leſs than Declination and of ſame Denomination.
Obſervations on different Sides of Noon, and Latitude greater than Declination or of a different Denomina.

N. B. The Number found by Table I. is $\frac{t,D}{t,L}$, that found by Table II. is s, T × t, M − vs, T and that found by Table III. is s, T × t, M + vs, T.

DEMONSTRATION.



HO, EQ, Dd, &c. repreſent the reſpective orthographic Projections of the Horizon, Equator, parallel of Declination, and on the Plane of the Meridian H E D Z O d Q and let r and s repreſent the Places of the Sun at the two Obſervations.

Put P = the Interval of Time between the Obſervations reduced into ſpace, A and a for the Altitudes.

When the Obſervations are on the ſame Side of Noon, $M = T + \frac{1}{2} P$; alſo,

$$rs : vr :: rad. : cs, L$$

$$cs, T - cs, \overline{T + P} : rs :: rad. : cs, D$$

$$\therefore cs, T - cs, \overline{T + P} : vr = s, A - s, a :: rad.^2 : cs, L \times cs, D$$

$$\text{or } s, \tfrac{1}{2} P \times s, M : cs, \frac{A + a}{2} \times s, \frac{A - a}{2} :: rad.^2 : cs, L \times cs, D$$

$$\text{or } s, M = cs, \frac{A + a}{2} \times s, \frac{A - a}{2} \times rad^2.$$

$$\overline{s, \tfrac{1}{2} P \times cs, L \times cs, D}$$

But $T = M - \frac{1}{2} P$ and $Dr = \frac{vs, T \times cs, D}{rad.}$

$$DF : Dr :: cs, L : rad. \therefore DF = \frac{vs, T \times cs, D \times cs, L}{rad^2.}$$

and s, Mer. Alt. = DF + s, A

The Lat. = { D ± computed Mer. Altitude when the Latitude and Declination are of the ſame Denomination. Computed Mer. Altitude − D when the Latitude and Declination are of different Denominations.

The above is the Subſtance of the Rule commonly given.

Now call c the Latitude thus found or the computed Latitude, then $\dot{c} = \pm$ Flux. Meridian Altitude, + when the Latitude is leſs than the Declination and of the ſame Name, otherwiſe —

but Flux. Mer. Alt. $= \frac{\dot{s}, \text{Mer. Alt.} \times \text{rad.}}{\text{cs, Meridian Alt.}} = \frac{\dot{DF}}{s, L \underset{\sim}{+} D}$ (rad. being = 1)

$$\therefore \dot{c} = \pm \frac{\dot{DF}}{s, L \underset{\sim}{+} D} = \pm \frac{cs, D}{s, L \underset{\sim}{+} D} \times \overline{\dot{vs}, T \times cs, L + vs, T \times \dot{cs}\, L}$$

It appears from above that $\dot{T} = \dot{M} = \frac{\dot{s}, M}{cs, M} = \frac{\dot{s}, M}{s, M} \times$, t, M $=$

$$- \frac{\dot{cs}, L}{cs, L} \times t, M = \dot{L} \times t, L \times t, M \quad \therefore \overline{\dot{vs}, T} = s, T \times \dot{T} = \dot{L}$$

$\times$ t, L $\times$ t, M $\times$ s, T also $\overline{\dot{cs}, L} = - \dot{L} \times s, L$:

Conſequently $\dot{c} = \pm \frac{cs, D \times \dot{L}}{s, L \underset{\sim}{+} D} \times \overline{s, T \times t, M \times t, L \times cs, L - vs, T \times cs, L}$

$$= \pm \frac{cs, D \times s, L \times \dot{L}}{s, L \underset{\sim}{+} D} \times \overline{s, T \times t, M - vs, T} = \pm \frac{cs, D \times s, L \times \dot{L}}{s, L \times cs, D \underset{\sim}{+} cs, L \times s, D}$$

$$\times \overline{s, T \times t, M - vs, T} = \frac{\pm \dot{L}}{1 \underset{\sim}{+} \frac{t, D}{t, L}} \times \overline{s, T \times t, M - vs, T}$$

$$= \pm \frac{\dot{L}}{m}, \text{ putting } m = \frac{1 \underset{\sim}{+} \frac{t, D}{t, L}}{s, T \times t, M - vs, T}$$

What is true for the Fluxions will be nearly ſo for the Increments, and will be ſufficiently true for Nautical Purpoſes even when the Increments are large. Let r = Latitude by Account, and t = the true Latitude; then $t \sim r : t \sim c :: m : 1$ $\therefore$ $t \sim c : r \sim c :: 1 : m \pm 1$, or $t \sim c = \frac{r \sim c}{m \pm 1}$ Q. E. D.

In the ſame manner the Truth of the Formulas may be proved when the Obſervations are on different Sides of Noon.

EXPLANATION AND USE OF THE ARTICLES CONTAINED IN THE ASTRONOMICAL and NAUTICAL EPHEMERIS.

IT may be proper firſt to premiſe, that all the Calculations of the *Ephemeris* are made according to apparent Time by the Meridian of the *Royal Obſervatory* at *Greenwich*: And the Sun's, Planet's, and Moon's Places, with the Particulars depending on them in the IId, IVth, Vth, VIth, and VIIth Pages of each Month, are computed to the Inſtant of apparent Noon, or that of the Sun's Center paſſing the Meridian of *Greenwich*.

Apparent Time, at any Place, is that deduced immediately from the Sun, whether from the Obſervation of his paſſing the Meridian, from his Altitude obſerved at a Diſtance from the Meridian, or from his obſerved Riſing or Setting. This Time is different from that ſhewn by Clocks and Watches well regulated at Land, which is called equated or mean Time. This will be explained when we come to treat of the Equation of Time.

The Day is here ſuppoſed, according to the Method of Aſtronomers, to begin at noon or 12 Hours later than the civil Day of the ſame Denomination, and to be counted up to 24 Hours or the ſucceeding Noon, when the next Day begins. Thus the Day of the Month and the Hour of the Day are the ſame in this Method as in the civil Account at Noon, and from Noon till Midnight; but from Midnight till Noon they differ; for whereas in the civil Account a freſh Day is ſuppoſed to begin at Midnight, and the Hours to begin over again, in this Method the Day is ſtill continued beyond Midnight, and the Reckoning of the Hours is continued up to 24. Thus the Diſtances put down to January 10, XV Hours belong to January 11 at Three in the Morning by Civil Reckoning.

There are XII. Pages for every Month. The firſt Column of the firſt Page of each Month contains the Day of the Week expreſſed conciſely by the initial Letter or Letters, *Sun.* ſtanding for Sunday, M. for Monday, Tu. for Tueſday, W. for Wedneſday, Th. for Thurſday, F. for Friday, and Sa. for Saturday: the ſecond the Day

of the Month: the third Column exhibits the Sundays and Feſtivals of the Church of England, and other remarkable Days: The laſt Column ſhews at Top the Moon's Phaſes, or the Times of New and Full Moon, and of the firſt and laſt Quarter or two Quadratures with the Sun: Beneath are contained miſcellaneous Phænomena, namely, Eclipſes of the Sun and Moon, and Occultations of Planets or fixt Stars not leſs than the fourth Magnitude, by the Moon, as they ſhould happen at *Greenwich* by the Tables; the Conjunctions of the Moon with all Stars not leſs than the fourth Magnitude, which can be Occultations any where on the Globe, between the Latitudes of 60° North and 40° South: The Entrance of the Sun into the ſeveral Signs, and any other remarkable Phænomena.

The Stars are expreſſed by *Bayer*'s Characters of Reference. The Conjunction of the Moon or a Planet with a Star is denoted by prefixing the Character of the Moon or Planet to that of the Star, the Time of the Conjunction being placed immediately before. The Caſe is the ſame with reſpect to the Occultation of a Star or Planet by the Moon, only this is further diſtinguiſhed by the Addition of Im. or Immerſion, to ſignify the Diſappearance behind the Moon; and Em. or Emerſion, to ſignify the Re-appearance of the ſame. Thus $8^d.\ 16^h.\ 22'$ ☽ ♑ ♈, ſignifies that the Moon will be in Conjunction with the Star ♑ ♈ on the Eighth Day at $16^h.\ 22'$, excluſive of Parallax: And $10^d.\ 9^h.\ 14'$. Im. of ε ♊. $10^d.\ 10^h.\ 23'$ Em. ſignifies that the Moon will eclipſe ε ♊ on the 10th Day, the Immerſion being at $9^h.\ 14'$, and the Emerſion at $10^h.\ 23'$ apparent Time at *Greenwich*.

The Occultations ſet down are thoſe only viſible at *Greenwich*; the Circumſtances of which will commonly not differ very widely in moſt Parts of the Kingdom; but in very diſtant Places they will differ very much, owing to the Change of the Moon's Parallax, or it may become no Occultation at all: The like may be ſaid of Eclipſes of the Sun.

An Eclipſe of the Sun, or Occultation of a fixt Star by the Moon, if obſerved in a Place whoſe Latitude and Longitude are well determined, may be applied to the Correction of the Lunar Tables; but if made in a Place whoſe Latitude only is well known, may be applied to the Determination of the Longitude of the Place; but for this Purpoſe an accurate Calculation muſt be made of the Moon's Parallaxes in Longitude and Latitude, which makes this Method of ſettling the Longitude of Places, though a very accurate one, leſs convenient in Uſe for Perſons not much verſed in aſtronomical Calculations. However, this ought not to diſcourage Travellers or Mariners from endeavouring to make theſe Obſervations as often and as carefully as poſſible, when they ſhall happen to be at any Place whoſe Longitude they have Reaſon to think has not been well ſettled; ſince the neceſſary Calculations may be made at any time afterwards by themſelves, at Leiſure, or referred to the Skill of Aſtronomers and Mathematicians.

Eclipſes of the Moon are not liable to this Inconvenience; the Longitude of any Place, where the Eclipſe has been obſerved, being deduced immediately by taking the Difference of the Time of the Obſervation and that ſet down in the *Ephemeris*, and converting it into Degrees, at the Rate of 15° to One Hour, &c. or more briefly by Table XIV. Page 38 of the 2d Edition of the Tables requiſite to be uſed with the *Ephemeris*. But, as the Beginning or Ending of an Eclipſe of the Moon cannot be generally obſerved nearer than One Minute, and ſometimes Two or Three Minutes of Time, the Longitudes of Places cannot be certainly determined by this Method from a ſingle Obſervation of the Beginning or End nearer than a Degree. Even this Point of Exactneſs will often be of great Service. If both the Beginning and End of the Eclipſe be obſerved, a greater Degree of Exactneſs will be attained.

The Conjunctions of the Moon with the Planets, or fixt Stars not leſs than the fourth Magnitude, which may prove Occultations in ſome inhabited Parts of the Globe, are evidently deſigned to inſtruct Mariners or Travellers to look out frequently for ſuch Obſervations; which if they happen to prove Occultations, and are carefully obſerved, will afford a certain means of determining the Longitude of the Place of Obſervation.

The Two firſt Columns of the Second Page of the Month contain the Day of the Week and Month as before; next follow the Sun's Longitude, right Aſcenſion in Time, Declination, and the Equation of Time with its Difference from Day to Day.

The Longitude of the Sun is made uſe of in moſt of the ſucceeding Calculations of the *Ephemeris*, and may ſerve either to verify them, or to make other ſimilar Calculations at a different Time of the Day. Particularly it may ſerve, with the Help of the Moon's Longitude, to find the Diſtance of the Moon from the Sun at any Time, independent of the Diſtances contained in the VIIIth, IXth, Xth, and XIth pages of the Month. To find the Sun's Longitude at any Time different from Noon, Proportion muſt be made according to its daily Increaſe: Saying, as 24^h. is to the Hour from Noon reckoned by the Meridian of *Greenwich*, ſo is the Daily Variation of the Sun's Longitude, to a fourth Number; which added to the Sun's Longitude at the preceding Noon, gives the true Longitude at the given Time.

If the Time given be that of a Meridian different from *Greenwich*, it muſt be firſt reduced thereto, by adding or ſubtracting the Difference of Longitude turned into Time (at the Rate of One Hour to 15°. and One Minute of Time to 15 Minutes, or more briefly by Table XIV. Page 38, of the *Requiſite Tables*) according as the Place is to the Weſt or to the Eaſt of *Greenwich*. Example: Suppoſe any one ſhould want to know the Sun's Longitude, January 19, 1767, at 4^h. 35′, being in 21°. 15′ Longitude Eaſt of *Greenwich*. The Difference of Longitude turned into Time is 1^h. 25′ which ſubtracted from 4^h. 35′ becauſe the Place is Eaſt of *Greenwich*, leaves 3^h. 10′ for the Time re-

duced to the Meridian of *Greenwich*. The Sun's Longitude the preceding Noon is 9°. 29°. 18′. 2″, and the following Noon it is 10°. 0°. 19′. 4″, the Difference is, 1°. 1′. 2″, or 61′. 2″, the daily variation. Then ſay as 24ʰ. is to 3ʰ. 10′, ſo is 61′. 2″, to 8′. 3″, which added to 9°. 29°. 18′. 2″, the Sun's Longitude on the preceding Noon, gives 9°. 29°. 26′. 5″, the Sun's Longitude at the Time given. In like Manner any other of the following Articles is to be found by the Help of the *Ephemeris*.

The Sun's Longitude ſerves alſo to compute the Aberration of the fixt Stars and Planets.

The ſun's right Aſcenſion in Time is uſeful to the practical Aſtronomer in regular Obſervatories, who adjuſts his Clocks by fidereal Time. It is alſo uſeful to him for converting apparent into fidereal Time; as ſuppoſe that of an Eclipſe of Jupiter's Satellites, in order to know at what Time it may be expected to happen by his Clocks: For this Purpoſe the Sun's right Aſcenſion at the preceding Noon, together with the Increaſe of right Aſcenſion from Noon, muſt be added to the apparent Time of the Phænomenon ſet down in the *Ephemeris*.

The Sun's right Aſcenſion in Time ſerves alſo to compute the apparent Time of a known Star's paſſing the Meridian: Thus, ſubtract the Sun's right Aſcenſion in Time at Noon from the Star's right Aſcenſion in Time, the Remainder is the apparent Time of the Star's paſſing the Meridian nearly; from which the proportional Part of the daily Increaſe of the Sun's right Aſcenſion for this apparent Time from Noon being ſubtracted, leaves the correct Time of the Star's paſſing the Meridian.

Hence the apparent Time may be found from an obſerved Altitude of a known fixt Star, ſuppoſe one contained in Page 7, of the *Requiſite Tables*; as will be explained hereafter.

The Sun's right Aſcenſion in Time is alſo uſeful for computing the Time of the Moon and Planets paſſing the Meridian, as will be ſhewn under their proper Articles.

The Sun's Declination is neceſſary to find the Latitude, whether at Sea or Land, from the Meridian Altitude obſerved; it is alſo requiſite for finding the Latitude from Two Altitudes obſerved with the Interval of Time meaſured by a Watch; it ſerves for computing the Sun's Azimuth, having his Altitude and the Latitude of the Place given, in order to find the Variation of the Compaſs; it is required, jointly with the Latitude of the Place and the Sun's horary Angle, to compute his Altitude, if neglected to be obſerved at the Time of taking the Moon's Diſtance from the Sun for finding the Longitude, being uſeful to facilitate the Calculation of the Effect of Refraction and Parallax upon the Diſtance; it is alſo neceſſary to calculate the apparent Time from an obſerved Altitude of the Sun at a Diſtance from the Meridian, the Latitude being given; or to compute the Time of the Sun's Setting or Riſing; which, though a leſs accurate Method than the former of obtaining the Time, may yet be uſeful when that cannot be had. For any of theſe Purpoſes the Sun's Declination muſt

be found to the Time given nearly, reduced to the Meridian of *Greenwich*, making Proportion according to the daily Increaſe or Decreaſe, in like manner as was ſhewn with reſpect to the Sun's Longitude.

The Equation of Time is a Correction, which added to, or ſubtracted from the apparent Time (according to its Title at the top of the Column) gives equated or mean Time, or that which ſhould be ſhewn by a good Clock or Watch. Apparent Time is that which takes its Beginning from the Paſſage of the Sun's Center over the Meridian of any Place; and had the Sun no Motion in the Ecliptic, or was his Motion reduced to the Equator or in right Aſcenſion uniform, he would always return to the Meridian after equal Intervals of Time. But his apparent Motion in the Ecliptic being continually varying, and his Motion in right Aſcenſion being rendered further unequal on account of the Obliquity of the Ecliptic to the Equator, from theſe Cauſes it ariſe that the Intervals of his Return to the Meridian become unequal, and the Sun will gradually come too ſlow or too ſoon to the Meridian for an equable Motion, ſuch as that of Clocks and Watches ought to be.

This Retardation or Acceleration of the Sun's coming to the Meridian is called the Equation of Time, and is contained in the laſt Column but One of Page II. and when applied according to its Title to the apparent Time, or that deduced immediately from the Sun, gives the mean or equated Time, whence the Error of a Clock or Watch may be found, and, if required, it may be corrected.

If it it be propoſed to convert mean Time into apparent, this is done by a contrary Proceſs, by applying the Equation of Time to the mean Time given, with its Title or Sign changed; *viz.* ſubtracting inſtead of adding, and adding inſtead of ſubtracting.

The Equation of Time being ſet down in the *Ephemeris* for Noon at *Greenwich*, Proportion muſt be made, according to the daily Difference, to find what it ſhould be at any given Time reduced to the ſame Meridian, as in the preceding Articles. The laſt Column of this Page, containing the daily Differences of the Equation, is deſigned for this Purpoſe.

As often as it may be required to make any Calculations from aſtronomical Tables, and the Time given be apparent Time; it is neceſſary firſt to apply the Equation of Time thereto to convert it into mean Time, the Tables being diſpoſed according to mean Motions. Thus the Articles contained in the *Ephemeris* anſwering to Noon were computed to 0^h. increaſed, or 24 Hours of the preceding Day diminiſhed, by the Equation of Time: And the moon's places ſet down for midnight were computed to 12^h. increaſed or diminiſhed by the Equation of Time.

What has been ſhewn concerning the Equation of Time chiefly reſpects the Aſtronomer, the Mariner having nothing to do with it in computing his Longitude from the Moon's Diſtances from the Sun and Stars obſerved at Sea with the Help of the *Ephemeris*, all the

Calculations thereof being adapted to apparent Time, the ſame which he will obtain by the Altitudes of the Sun or Stars in the manner hereafter preſcribed.

But if Time-keepers ſhould be brought into Uſe at Sea, the apparent Time deduced from an altitude of the Sun muſt be corrected by the Equation of time, and the mean Time found compared with that ſhewn by the Watch; the Difference will be the Longitude in Time from the Meridian by which the Watch was ſet, as near as the Going of the Watch can be depended upon.

The Equation of Time is computed by taking the Difference of the Sun's true right Aſcenſion and his mean Longitude corrected by the Equation of the Equinoxes in right Aſcenſion, and turning it into Time at the Rate of 1′. to 15′. &c. The Equation of Time will be additive or ſubtractive as the Sun's true right Aſcenſion is greater or leſs than his mean Longitude ſo corrected.

The Time of the Sun's Semidiameter paſſing the Meridian, Page III. ſerves to reduce an Obſervation of a Tranſit of the preceding or ſubſequent Limb over the Meridian to that of the Center, when only One was obſerved. It ſignifies a Portion of apparent Time, or even mean Time, the Difference being abſolutely inſenſible upon ſo ſmall an interval. It is found thus: Increaſe the Sun's Semidiameter in the Ratio of the Coſine of his Declination to the Radius, to find his Semidiameter in right Aſcenſion, which turned into Time at the Rate of 1′ to 15′. and 1″ to 15″ gives the Time required. The Sun's Semidiameter in right Aſcenſion is readily found by adding the Log. Coſine of his Declination to the logiſtic Logarithm of his Semidiameter, the Sum is the logiſtic Logarithm of his Semidiameter in right Aſcenſion; which divided by 15 gives the Time of his Semidiameter paſſing the Meridian. If the Clock by which the Obſervation is made be regulated according to the ſidereal Time, this Quantity muſt be increaſed in the Ratio of 365 to 366, if great Preciſion is required. From the Time of the Sun's Semidiameter paſſing the Meridian may alſo be found the Time of its paſſing the horizontal or vertical wire of Quadrant or Sextant, which on ſome Occaſions may have its Uſe.

The Semidiameter of the Sun, is neceſſary to reduce the obſerved Altitude of his upper or lower Limb to that of the Center; alſo to reduce the obſerved Diſtance of the Moon's neareſt Limb from the Sun's neareſt Limb to the Diſtance of the Centers. It is alſo uſeful to Aſtronomers to verify or aſcertain the Exactneſs of the Scale of their Micrometers, by compariſon with the meaſure of the Sun's horizontal Diameter. This Practice is particularly uſeful in ſolar Eclipſes, when the Diſtance of the Cuſps or the Verſe Sine of the uneclipſed Part has been meaſured with the micrometer. The Semidiameters of the Sun in *Mayer*'s Tables, on which all the Calculations reſpecting the Sun and Moon are made, ſuppoſe the Semidiameter at the mean Diſtance to be 16′. 2″, 8. which Mr. *Mayer* ſays he deduced from above 130 Obſervations taken with his Six Feet mural Quadrant, which ſeemed to him not ill adapted to the Purpoſe. It may not be amiſs to take this

Opportunity to remark, that the Quadrant here mentioned was given to the *Univerſity of Gottingen* by his late Majeſty, and was made by that ingenious Artiſt the late Mr. *John Bird* after the Model of the Eight Feet mural Arch, which he finiſhed for the *Royal Obſervatory* at *Greenwich*, and put up there in the Year 1750. Mr. *Mayer* made his Obſervations with his Six Feet mural Arch, from the Year 1756, to the Time of his Deceaſe; with it he ſettled the mean Obliquity of the Ecliptic to the Beginning of the Year 1756, at 23°. 28′. 16″, which Dr. *Bradley* ſettled by his Obſervations, reduced to the Year 1750, at 23°. 28′. 18″. The Difference is agreeable to what ought to ariſe from the gradual Diminution of the Obliquity of the Ecliptic at the Rate of about ½ a Second in a Year. The ſame Inſtrument he alſo uſed in ſettling the Elements of his ſolar Tables; and it is moſt probable that with the ſame he ſettled his Table of Refractions at the End of his ſolar Tables; the Agreement of this Table with Dr. *Bradley*'s, ſee Page 1ſt of *Requiſite Tables* (being both ſuited to the ſame Temperature of the Air) is ſo great, that they ſeem rather like One and the ſame than two different Tables.

The hourly Motion of the Sun is uſeful in computing ſolar and lunar Eclipſes; alſo in correcting the aſſumed Longitude of the Ship, in order to find the Time from an Obſervation of the Diſtance of the Moon from the Sun, independent of the Diſtances contained in the *Nautical Ephemeris*; See *Britiſh Mariner's Guide*, Page 49, and Table at the End of the ſame, Page 25. The Logarithm of the Sun's Diſtance is uſeful in the Calculation of the Places of the Planets and Comets. The Place of the Moon's Node ſignifies its mean Longitude, and is neceſſary for finding the Equation of the equinoctial Points both in Longitude and right Aſcenſion, the Equation of the Obliquity of the Ecliptic, and the Deviations of the fixed Stars in right Aſcenſion and Declination.

The Eclipſes of Jupiter's Satellites are well known to afford the readieſt, and for general Practice the beſt Method of ſettling the Longitudes of Places at Land; and it is by their Means principally that Geography has been ſo much reformed within a Century paſt, and the Poſitions of moſt diſtant Places determined with equal Accuracy to the neareſt. It was hoped that ſome Means might be found of uſing proper Teleſcopes on Shipboard to obſerve theſe Eclipſes; and could this be effected, it would be of great Service in aſcertaining the Longitude of a Ship from time to time. In my Voyage to *Barbadoes*, under the Direction of the COMMISSIONERS OF LONGITUDE, in 1763 I made a full Trial of the late Mr. *Irwin*'s Marine Chair propoſed for this Purpoſe, but could not derive any Advantage from the Uſe of it; and, conſidering the great Power requiſite in a Teleſcope for making theſe Obſervations well, and the Violence as well as irregularities of the Motion of a Ship, I am afraid the complete Management of a Teleſcope on Shipboard will always remain among the Deſiderata. However, I would not be underſtood to mean to diſcourage any

Attempt founded upon good Principles to get over this Difficulty.

The Teleſcopes proper for obſerving the Eclipſes of Jupiter's Satellites, are common refracting Teleſcopes from 15 to 20 Feet, reflecting Teleſcopes of 18 Inches or Two Feet focal Length, and Teleſcopes of Mr. *Dolland*'s Conſtruction with Two Object Glaſſes from 5 to 10 Feet; or, which are ſtill more convenient, thoſe of 46 Inches focal Length, conſtructed with Three Object Glaſſes, which are as manageable as reflecting Teleſcopes, and perform as much as thoſe which he makes of 10 Feet with Two Object Glaſſes.

The Eclipſes of Jupiter's Satellites are obſerved by Aſtronomers at Land, as well in order to provide Materials for improving the Theories and Tables of their Motions, as for the ſake of Compariſon with the correſponding Obſervations which may be made by Perſons in different Parts of the Globe, whereby the Longitude of ſuch Places will be accurately aſcertained. It is indeed to be lamented that Perſons, who viſit diſtant Countries, are not more diligent to multiply Obſervations of this Kind; for want of which, the Obſervations made by Aſtronomers in eſtabliſhed Obſervatories loſe Half their Uſe, and the Improvement of Geography is retarded. But it is to be hoped that an Emulation will ſpring up among thoſe who may have Opportunities of rendering ſo uſeful a Service to the Public, to incite them to watch diligently for the Occaſions of obſerving theſe Eclipſes carefully, particularly of the Firſt and Second, which are moſt exact for the Purpoſe. The Eclipſes, carefully calculated and ſet down in the *Ephemeris*, will ſerve to advertiſe them and Obſervers in general of the Times when they ſhould attend to theſe Obſervations. The Perſon, who ſhall be under any Meridian different from *Greenwich*, muſt turn his Difference of Longitude into Time: See *Requiſite Tables*, Page 38, and add it to or ſubtract it from the Time of the Eclipſe ſet down in the *Ephemeris*, according as he is to the Eaſt or Weſt of *Greenwich*, to find the apparent Time at which the Eclipſe will happen at his Meridian, nearly. He muſt further take care to regulate his Watch or Clock by apparent Time, or at leaſt to know the Difference, as well in order to apprize him of the Time to look out for the Eclipſe, as for aſcertaining the apparent Time exactly at which he ſhall obſerve it. Equal Altitudes of the Sun or Stars taken with an Aſtronomical Quadrant afford the beſt Means of regulating Clocks and Watches for occaſional Obſervations; or they may be taken with a *Hadley*'s Quadrant, by Reflection from a Baſon of Water or Quickſilver, or from the Horizon of the Sea, if the Obſerver has an open Proſpect, and is not elevated above 5 or 600 Feet above the Level of the Sea. But, if Opportunity does not admit of taking equal Altitudes, the Time may be determined from One Altitude taken in any of the Methods above-mentioned, at leaſt Two or three Points of the Compaſs diſtant from the Meridian, but the nearer to the Eaſt or Weſt the better, the Latitude of the Place being known, or being found by Obſervations of the Meridian Altitude of the Sun or Stars made

on

on Purpoſe. It will be better to take ſeveral Altitudes in order to take a mean of the Reſults for greater Certainty. And if one Star be obſerved to the Eaſt and the other to the Weſt of the Meridian, the Time will be determined with rather more Certainty. The Manner of computing the apparent Time from the Altitude of the Sun or a Star is ſhewn by Problems VIII. and IX. Pages 25 and 26 of the Explanation and Uſe of the *Requiſite Tables*.

The Obſerver, being in a Place whoſe Longitude is well known, ſhould be ſettled at his Teleſcope Three Minutes before the expected Time of an Immerſion of the firſt Satellite; Six or Eight Minutes before that of the ſecond and third Satellites; and a Quarter of an Hour or more before that of the fourth Satellite; chiefly on account of the Uncertainty of their Theories; but if the Longitude of the Place is very uncertain, he muſt begin to look out for the Eclipſe proportionably ſooner: Thus, if the Longitude of the Place is uncertain to 3 Degrees, anſwering to 12 Minutes of Time, he ought to fix himſelf to his Teleſcope 12 Minutes ſooner than is mentioned above. Nevertheleſs, when he has obſerved one Eclipſe of any Satellite, and thereby found the Error of the Tables, he may allow the ſame Correction to the Calculations of the *Ephemeris* for ſeveral Months, which will advertiſe him very nearly of the Time of expecting the Eclipſes of the ſame Satellite, and diſpenſe with his attending ſo long.

The Immerſions ſignify the Inſtant of the Diſappearance of the Satellite by entering into the Shadow of Jupiter; and the Emerſions ſignify the firſt Inſtant of its Appearance at coming out of the ſame. They generally happen when the Satellite is at ſome Diſtance from the Body of Jupiter, except near the Oppoſition of Jupiter to the Sun, when the Satellite approaches nearer to his Body. Before the Oppoſition of Jupiter to the Sun the Immerſions and Emerſions happen on the Weſt Side of Jupiter, and after the Oppoſition on the Eaſt Side; but, if an Aſtronomical Teleſcope be uſed, which reverſes Objects, the Appearance will be directly the contrary. Before the Oppoſition, the Immerſions only of the firſt Satellite are viſible; and after the Oppoſition, the Emerſions only. The ſame is generally the Caſe with reſpect to the ſecond Satellite; both the Phænomena of the ſame Eclipſe are frequently obſervable in the two outer Satellites. The Immerſions and Emerſions marked with an Aſteriſk in the *Ephemeris*, are thoſe viſible at *Greenwich*.

To know if an Eclipſe will be viſible in any Place, find whether Jupiter be 8°. above the Horizon of the Place, and the Sun as much below it. This may be done near enough by a celeſtial Globe: Otherwiſe, the Time of the Sun's Riſing and Setting may be found for any Latitude by a Table of ſemidiurnal Arcs, contained in the popular Book called *The Mariner's Compaſs Rectified*, and many other Books; the Time of Jupiter's Riſing and Setting may alſo be found from the Time of his paſſing the Meridian and Declination ſet

down in the *Ephemeris*, with the Help of the ſame Table of ſemidiurnal Arcs; adding or ſubſtracting the ſemidiurnal Arc anſwering to the ſame Declination of the Sun: Remembering always, that if Jupiter's Declination and the Latitude of the Place are of the ſame Denomination, the ſemidiurnal Arc will be more than Six Hours, and if they are of contrary Denominations, will be leſs than Six Hours. But it may be eaſier found whether the Eclipſe will be viſible at *Greenwich*, or whether it ſhould be properly marked with an Aſteriſk. By the Tables, Page 28—31, annexed to the *Nautical Almanac* of 1772.

The Immerſion or Emerſion of any Satellite being carefully obſerved in any Place according to apparent Time, the Longitude from *Greenwich* is found immediately by taking the Difference of the Obſervation from the correſponding Time ſhewn in the *Ephemeris*, which muſt be turned into Degrees, &c. by *Requiſite Tables*, Page 38; and will be Eaſt or Weſt of *Greenwich*, as the Time obſerved is more or leſs than that of the *Ephemeris*.

Example; Suppoſe an Emerſion of the firſt Satellite ſhould be obſerved at the *Cape of Good Hope*, May 9, 1767, at $10^h. 46'. 45''$ apparent Time: The Time by the *Ephemeris* being $9^h. 33'. 12''$ the Difference is $1^h. 13'. 33''$, whence the Longitude of the *Cape* ſhould be $18^o. 23'. 15''$ Eaſt of *Greenwich*, becauſe the Time ſuppoſed to be obſerved at the *Cape* is more than that of the *Ephemeris*.

It is to be obſerved that a correſpondent Obſervation of an Eclipſe of a Satellite of Jupiter, made under a well-known Meridian, is to be preferred to the Calculations of the *Ephemeris* for comparing with an Obſervation made in a Meridian whoſe Longitude is required; but if no correſponding Obſervation can be obtained, as is frequently the Caſe, it will be beſt to find what correction the Calculations of the *Ephemeris* require by the neareſt Obſervations to the given Time that can be obtained; which Correction applied to the Calculation of the given Eclipſe in the *Ephemeris*, renders it almoſt Equivalent to an actual Obſervation.

The Longitudes and Latitudes of the Planets, Page IV. ſerve to know where to look for them in the Heavens, and when their Places may be conveniently ſettled by comparing them with fixed Stars by the Help of a Micrometer in a Teleſcope. They alſo ſhew when they are in the moſt important Points of their Orbits, where it is moſt material to obſerve them. They alſo ſerve to enable Perſons leſs ſkilled to diſtinguiſh them from the fixed Stars. Their Declinations and the apparent Times of their paſſing the Meridian are particularly uſeful to Aſtronomers who are furniſhed with Quadrants and Tranſit Inſtruments well fixed in the Meridian, in ſetting their Inſtruments for obſerving their right Aſcenſions and Declinations.

The apparent Time of a Planet's paſſing the Meridian may be computed thus; the Planet's Right Aſcenſion being calculated from its Longitude and Latitude, and turned into Time, ſubſtract the Sun's Right Aſcenſion at Noon in Time from it, to find the Time of the

Planet's paſſing the Meridian nearly, which call T; take the difference of the ☉ and Planet's daily Variations in right Aſcenſion in Time, if the Planet is progreſſive in right Aſcenſion, or the Sun, if it is retrograde, which call X; then ſay by the Rule of Proportion;

As $14^h \mp X : T :: X : e$ and $T \pm e$ will be correct Time of the Planet's paſſing the Meridian. The upper Signs are to be uſed both to X and e if the Planet's progreſſive Motion in right Aſcenſion be greater than that of the Sun; in any other Caſe the lower Signs are to be made uſe of.

But perhaps it may be found more readily by continual Approximation as follows. Take the proportional Part of the Difference or Sum of the ☉ or Planets's daily Motion in right Aſcenſion, anſwering to the Time of the Planet's paſſing the Meridian, found nearly, in Proportion to 24^h. and take a further like proportional Part of this proportional Part; and again of this laſt, and ſo on as far as is neceſſary. The Sum of all theſe proportional Parts added to the Time of the Planet's paſſing the Meridian found nearly, if the Planet's progreſſive Motion in right Aſcenſion is greater than that of the Sun, otherwiſe ſubſtracted, gives the apparent Time of the Planet's paſſing the Meridian.

Example: Let it be required to find the Time of the Moon's paſſing the Meridian, July 1, 1767.

The Sun's right Aſcenſion in Time July 1ſt is, 6^h 40′. 25″ and July 2d, 6^h. 44′. 33″ by the *Ephemeris*. Therefore his daily Motion in right Aſcenſion is 4′. 8″. The Moon's right Aſcenſion July 1ſt at Noon by the *Ephemeris* is 159°. 2′ anſwering to 10^h. 36′. 8″ of Time, and July 2d is 169°. 39′ anſwering to 11^h. 18′. 36″. The Difference is 42′. 28″ of Time, from which 4′. 8″ being ſubſtracted, leaves 38′. 20″. Subſtract 6^h. 40′. 20″ the Sun's right Aſcenſion July 1ſt at Noon, from 10^h. 36′. 8″ the Moon's right Aſcenſion the ſame Noon, the Remainder 3^h. 55′. 43″ is the Approximate Time of the Moon's paſſing the Meridian. The proportional Part of 38′. 20″, anſwering to this, is 6′. 17″, and the proportional Part of 6′. 17″ is 9″; therefore 6′. 17″ and 9″ or 6′. 26″ added to 3^h. 55′. 43″ give 4^h. 2′. 9″, the apparent Time of the Moon's paſſing the Meridian. In the *Ephemeris* it is 4^h. 2′. It may alſo be computed by taking the Difference of the Moon's right Aſcenſion at Noon and Midnight, but then Half the Sun's daily Variation in right Aſcenſion muſt be made uſe of, and Proportion muſt be made for 12 inſtead of 24 Hours: and if the Moon paſſed the Meridian after Midnight, the Sun's right Aſcenſion at Midnight muſt be uſed, which is a Mean between his right Aſcenſions on the preceding and ſubſequent Noon. For the Planets it will be ſufficient to take the firſt proportional Part only.

The Days of the Oppoſitions, Quadratures, &c. of the Planets to the Sun, are Times at which they ought to be obſerved in fixed Obſervatories, for ſettling the Elements of their Orbits by a Series of ſeveral Years Obſervations.

The Vth, VIth, VIIth, VIIIth, IXth, Xth, and XIth Pages of each Month contain the Moon's Place, and all the Circumſtances relating to her Motion, and her Diſtances from the Sun and proper Stars, from which her Diſtance ſhould be obſerved for finding the Longitude at Sea. The Longitude, Latitude, and Declination of the Moon, and Time of her paſſing the Meridian, afford the like Uſes of the ſame Circumſtances of the Planetary Motions, and many more beſides. For the ſake of greater Preciſion, the Moon's Longitude, Latitude, Right Aſcenſion, Declination, Semidiameter, horizontal Parallax, with its proportional Logarithm, are computed Twice a Day, to Noon and Midnight, and may readily be inferred to any intermediate Time with the greateſt Exactneſs.

Example: Let it be required to find the Moon's Longitude and Latitude, &c. July 16, 1767, at $16^h. 22'. 16''$.

Firſt to find the Longitude.

The Moon's Longitude, July 16, at $12^h.$ is $0^s. 6^\circ. 40'. 25''$ and July 17, at Noon, $0^s. 13^\circ. 47'. 48''$ the Difference $7^s. 7'. 23''$ is the Moon's Motion in 12 Hours; ſay then by the Rule of Proportion:

As 12^h is to $4^h. 22'. 16''$ (the Exceſs of $16^h. 22'. 16''$ above 12^h) ſo is $7^\circ. 7'. 23''$ to $2^\circ. 35'. 41''$ but this muſt be corrected on account of the Moon's unequal Motion in 12 Hours, by the Table of Equation of ſecond Difference annexed to Mr. *Taylor's Sexageſimal Table*, Page 244—247: For this Purpoſe take out of the *Ephemeris* the Two Longitudes of the Moon next preceding the given Time, and the Longitudes immediately following it, and ſet them down in Order one after another as follows;

	☽'s Long. by the *Ephemeris*.	1ſt Diff.	2d Diff.	Mean of 2d Diff.
1767,	ˢ ° ′ ″	° ′ ″	′ ″	′ ″
July 16, Noon	11. 29. 29. 34			
Midnight	0. 6. 40. 25	7. 10. 51	3. 28	
17, Noon	0. 13. 47. 48	7. 7. 23	3. 44	3. 36
Midnight	0. 20. 51. 27	7. 3. 39		

Take their Differences, $7^\circ. 10'. 51''$, $7^\circ. 7'. 23''$, $7^\circ. 3'. 39''$; take the Differences of theſe Differences, or the ſecond Difference $3'. 28''$, $3'. 44''$; and take their Mean which is $3'. 36''$. Now look for the Equation of ſecond Difference, anſwering to $4^h. 22'$ after Midnight, found on the Side, and $3'. 36''$ at the Top, which will be found $=24''$, and which, according to the Remark at the Bottom of the Table, muſt be added to $2^\circ. 35'. 41''$, the firſt proportional Part, becauſe the Motion in 12 Hours or firſt Differences are decreaſing, the Sum $2^\circ. 36'. 5''$ added to $0^s. 6^\circ. 40'. 25''$, the Moon's Longitude at Midnight, gives $0^s. 9^\circ. 16'. 30''$, the Moon's true Longitude, and is as correct as the Longitudes from which it is deduced.

N. B. If the firſt Differences of the Four Longitudes of the Moon taken out firſt increaſe and then decreaſe, or, *vice verſâ*, firſt decreaſe and then increaſe, take Half the Difference of the Two ſecond Differences for the Mean ſecond Difference, with which take out the Equation of ſecond Difference, and add or ſubtract it as the Firſt firſt Difference is greater or leſs than the Third firſt Difference.

To find the Moon's Latitude.

Take out of the *Ephemeris* the Two Latitudes preceding and Two following the given Time, and ſet them down in Order, and take their firſt and ſecond Differences, and the Mean of the Two ſecond Differences; find the proportional Part of the Middle firſt Difference anſwering to the Hours and Minutes, &c. of the given Time after Noon or Midnight; which correct in the following Manner: Entering Table of Equation of ſecond Difference, Page 244—247, with the Hour from Noon or Midnight on the Side, and the Mean ſecond Difference at Top, take out the correſponding Number of Seconds, which added to or ſubſtracted from the proportional Part found above, according as the Motion in 12 Hours or firſt Difference is decreaſing or increaſing; or, more generally, according as Firſt firſt Difference is greater or leſs than Third firſt Difference, gives the proportional Part corrected; which now added to or ſubſtracted from the Moon's Latitude at the preceding Noon or Midnight, as the Latitude in theſe 12 Hours is increaſing or decreaſing, gives the Moon's Latitude correct.

Example: The Moon's Latitude is required, July 16, 1767, at $16^h. 22'. 16''$.

		☽'s Lat. by the *Ephemeris*.	1ſt Dif.	2d Dif.	Mean of 2d Dif.
1767,		° ′ ″	′ ″	′ ″	′ ″
July 16,	Noon	4. 31. 10 N.	18. 26	4. 36	4. 40
	Midnight	4. 49. 36	13. 50	4. 44	
17,	Noon	5. 3. 26	9. 6		
	Midnight	5. 12. 32			

The Moon's Latitude July 16 at Midnight being $4°. 49'. 36''$ N. and the Motion in the next 12 Hours being $13'. 50''$ ſay by Proportion,

As $12^h.$ is to $4^h. 22' 16''$, ſo is $13'. 50''$ to $5'. 2''$: but this muſt be corrected by adding $32''$, the Equation of ſecond Difference, anſwering to the Hour $4^h. 22'$, and the Mean ſecond Difference $4'. 40''$, becauſe the firſt Differences are decreaſing, or rather becauſe the firſt of them $18'. 26''$, is greater than the laſt of them $9'. 6''$, therefore the proportional Part corrected is $5'. 2'' + 32'' = 5'. 34''$, which added to $4°. 49'. 36''$, gives $4°. 55'. 10''$ N. the Moon's Latitude correct.

Remarks on ſome Circumſtances neceſſary to be attended to, in order to obtain and apply the Correction of ſecond Differences rightly in computing the Moon's Latitude.

I. If the Moon's Latitude taken out of the *Ephemeris* for Noon and Midnight changes its Denomination from North to South or from South to North, the Sum of the Two Latitudes of contrary Denominations, where the Change happens, is to be accounted the firſt Difference in that Place.

II. If the Three firſt Differences firſt increaſe and then decreaſe, or *vice verſâ*, firſt decreaſe and then increaſe, Half the Difference of the Two ſecond Differences is to be taken for the Mean ſecond Difference.

III. If the Series of Four Latitudes taken out ſhould firſt increaſe and then decreaſe about the Moon's greateſt Latitudes, take the Sum of the Two firſt Differences ſtanding on each Side of the greateſt Latitude for the ſecond Difference in that Place; correct the Moon's Latitude at Noon or Midnight by the ſimple proportional Part firſt found; and to the Latitude ſo corrected, add always in this Caſe the Equation of ſecond Difference from Page 244---247, anſwering to the Mean ſecond Differences.

Before I quit this Subject of Interpolation by ſecond Differences, I ſhall point out another Method, by which the ſame End may be obtained more readily, and with fewer Rules, by thoſe who are well acquainted with algebraic Subſtraction and Additon, and the Manner of applying the Signs in thoſe Operations. Subſtract each Latitude from the following for the firſt Differences, to which prefix the Sign — if the Latitudes decreaſe: and Subſtract each firſt Difference, thus found, from the following one of the ſame order for the ſecond Differences. Half the Sum of the Two ſecond Differences ſtanding on each Side of the Interval to be interpolated, is to be accounted the Mean ſecond Difference; the Equation correſponding to it by Table, Page 244---247, is to be applied always with the contrary Sign.

Theſe Operations are to be performed, and the Signs to be applied as in algebraic Subſtraction and Addition. Note further, if the four given Latitudes change their denomination, call the ſecond Latitude +, and thoſe of a contrary Denomination —.

The Moon's Declination may be found at any Hour in the ſame Manner as her Latitude; but as the Correction ariſing from ſecond Differences will never exceed $2'\frac{1}{2}$, this may be neglected on moſt Occaſions; but if any one is deſirous to obtain the Declination true to a Minute, the Correction is eaſily applied as ſhewn above.

The other Articles of Page VI. and V *viz.* the Moon's Right Aſcenſion, her Semidiameter, horizontal Parallax, with its proportional Logarithm, and the Diſtances contained in the Four laſt Pages of the Month, may be all found correctly by even Porportion, without requiring any Allowance on account of ſecond Differences. The proportional Part of the Moon's Longitude, *&c.* for any Hour may be found very readily by the Help of the Table of porportional Logarithms, Page 39—55 of the *Requiſite Tables*.

The Moon's Longitude and Latitude are uſed in computing her Diſtances from the Sun and Stars contained in the Four laſt Pages of

and adding it to or subſtracting it from the apparent Time at the ſhip, as its Longitude is Weſt or Eaſt of *Greenwich*. It will be ſufficient if the diſtance be computed from the *Ephemeris* within 10′, or 20′, for ſetting the Quadrant. The principal Uſe of the Diſtances of the Moon from the Sun and fixt Stars; namely, in determining the Longitude by compariſon with the correſponding Diſtances obſerved at Sea, is ſhewn in Problem XI. Page 37 of *Requiſite Tables*.

The Diſtances contained in the *Ephemeris* were computed ſtrictly to Noon and Midnight, and thence interpolated for every Three Hours according to the Method ſhewn for computing the Moon's Latitude Page 157—158; except that the Correction of ſecond Differences at the Middle of the Interval to be interpolated, was taken $\frac{1}{8}$ of the Mean of the Two ſecond Differences, and at the Firſt and Third Quarter of the Interval was taken $\frac{3}{4}$ of the Correction juſt found at the Middle of the Interval; inſtead of conſulting Mr. *Taylor*'s Table, Page 248 and 249, which would however have given the ſame Reſult. But, at the firſt 12 Hours, when the Diſtances of the Moon from a Star begin, and the laſt 12 Hours, when the Diſtances end, there being only One ſecond Difference inſtead of Two ſecond Differences on each Side to take a Mean of, this Method fails in theſe Caſes, and therefore the following is to be ſubſtituted in its ſtead, being derived from Sir *Iſaac Newton*'s Solution of the Problem of drawing a Curve through the Extremities of any Number of given Ordinates. *Phil. Nat. Princ. Math.* Page 486 Edit. *Londini* 1726, or Dr. *Horſley*'s complete Edition of Sir *Iſaac Newton*'s Works, Vol. 3d. Page 128.

From Four Diſtances at Noon and Midnight computed ſtrictly to interpolate Three Diſtances at the IIId, VIth, and IXth Hour of the firſt or laſt Interval.

Subſtract each Diſtance from the following, for the firſt Difference, and prefix the Sign —, if the Diſtances decreaſe. Subſtract each firſt Difference thus found from the following One of the ſame Order, for the ſecond Difference: And in like Manner ſubſtract the Firſt ſecond Difference from the following for the third Difference; applying the Signs as in algebraic Subſtraction. Denote the firſt or laſt firſt Difference by b; the firſt or laſt ſecond Difference by c, according as the Interpolation to be made is for the firſt or laſt 12 Hours; denote alſo the third Difference by d, and, a being put to ſignify the Diſtance at the Beginning of the Interval, the interpolated Diſtances will be as follows:

At IIId Hour of firſt Interval	$a + \frac{1}{3}b - \frac{3}{32}c + \frac{7}{1215}d$
At VIth Hour of firſt Interval	$a + \frac{1}{2}b - \frac{1}{8}c + \frac{1}{16}d$
At IXth Hour of firſt Interval	$a + \frac{2}{3}b - \frac{3}{32}c + \frac{1}{128}d$
Or,	
At IIId Hour of laſt Interval	$a + \frac{1}{3}b - \frac{3}{32}c - \frac{1}{128}d$
At VIth Hour of laſt Interval	$a + \frac{1}{2}b - \frac{1}{8}c - \frac{1}{16}d$
At IXth Hour of laſt Interval	$a + \frac{2}{3}b - \frac{3}{32}c - \frac{7}{1215}d$

that the Sun is. When ſhe is between the Diſtances of 40° and 90° from the Sun, her Diſtance is computed both from the Sun and from a Star on the contrary Side to the Sun; when the Moon is above 90° from the Sun her Diſtance is computed from Two Stars, one on each Side of her; though ſtill her Diſtance is computed alſo from the Sun from 90° to 120°. Though the Diſtance of the Moon from the Sun or Star, well obſerved with a good Inſtrument, is ſufficient to determine the Longitude, with the Help of the *Ephemeris*, always within a Degree, and generally much nearer, yet it will conduce to ſtill greater Accuracy, if the Obſerver takes the Diſtance of the Moon from Two Stars, or the Sun and a Star, or, when the Moon is between 90° and 120° Diſtant from the Sun, from the Sun and Two Stars, if he can be ſo lucky as to obtain theſe ſeveral Obſervations.

The Longitude being computed from the Obſervations made with each Star reſpectively, the Mean of the Reſults is to be taken as probably approaching neareſt to the true Longitude. In particular the Moon's Diſtance ſhould be taken from Two Stars, or the Sun and a Star on each Side of her, as often as Opportunity permits, ſince the Mean of the Reſults will probably be at leaſt as exact again as either ſeparately, I mean as far as depends on any Imperfection of the Inſtruments, and unavoidable ſmall Errors ariſing in the Uſe of them; Errors of theſe Kinds having a natural Tendency to correct each other; for that ſmall Error which ariſes from the Lunar Tables will affect the Reſult from either Star equally. But the Error of *Mayer*'s laſt Lunar Tables are corrected from a ſeries of Dr. *Bradley*'s Obſervations of 9 Years by Mr. *Charles Maſon* in 1778, being theſe made uſe of for the *Nautical Almanac* of 1789, and the ſubſequent ones, probably never exceeding 30″, the Uncertainty hence ariſing in the Determination of the Longitude, can ſcarcely ever exceed 17 Miles of Longitude, and generally will be much leſs.

The Diſtances ſet down in the *Ephemeris*, afford the Obſerver a ready Means of knowing the Star from which the Moon's Diſtance is to be obſerved; for he has nothing to do but to ſet his Quadrant to the Diſtance computed roughly from the *Ephemeris*, neglecting the Seconds, at the apparent Time eſtimated nearly by the Meridian of *Greenwich*; and direct his Sight to the Eaſt or Weſt of the Moon, according as the Diſtance at *Greenwich* is found in the VIIIth and IXth, or Xth and XIth Pages of the Month; and having found the Moon upon little Speculum, let him give a Sweep with the Quadrant to the Right and Left, and he will find the Star he ſeeks for, if above the Horizon and the Air be clear, nearly in a Line perpendicular to the Line of the Moon's Horns or longer Axis, or, which is the ſame Thing, in the Line of the Moon's ſhorter Axis produced. The Star is always one of the brighteſt, ſo that there is little Danger of miſtaking another for it, if the preceding Directions are carefully obſerved. The Time at *Greenwich* is eſtimated nearly by turning the ſuppoſed Longitude from *Greenwich* into Time, by *Requiſite Tables*, Page 38,

and adding it to or subſtracting it from the apparent Time at the ſhip, as its Longitude is Weſt or Eaſt of *Greenwich*. It will be ſufficient if the diſtance be computed from the *Ephemeris* within 10′, or 20′, for ſetting the Quadrant. The principal Uſe of the Diſtances of the Moon from the Sun and fixt Stars; namely, in determining the Longitude by compariſon with the correſponding Diſtances obſerved at Sea, is ſhewn in Problem XI. Page 37 of *Requiſite Tables*.

The Diſtances contained in the *Ephemeris* were computed ſtrictly to Noon and Midnight, and thence interpolated for every Three Hours according to the Method ſhewn for computing the Moon's Latitude Page 157—158; except that the Correction of ſecond Differences at the Middle of the Interval to be interpolated, was taken $\frac{1}{8}$ of the Mean of the Two ſecond Differences, and at the Firſt and Third Quarter of the Interval was taken $\frac{3}{4}$ of the Correction juſt found at the Middle of the Interval; inſtead of conſulting Mr. *Taylor*'s Table, Page 248 and 249, which would however have given the ſame Reſult. But, at the firſt 12 Hours, when the Diſtances of the Moon from a Star begin, and the laſt 12 Hours, when the Diſtances end, there being only One ſecond Difference inſtead of Two ſecond Differences on each Side to take a Mean of, this Method fails in theſe Caſes, and therefore the following is to be ſubſtituted in its ſtead, being derived from Sir *Iſaac Newton*'s Solution of the Problem of drawing a Curve through the Extremities of any Number of given Ordinates. *Phil. Nat. Princ. Math.* Page 486 Edit. *Londini* 1726, or Dr. *Horſley*'s complete Edition of Sir *Iſaac Newton*'s Works, Vol. 3d. Page 128.

From Four Diſtances at Noon and Midnight computed ſtrictly to interpolate Three Diſtances at the IIId, VIth, and IXth Hour of the firſt or laſt Interval.

Subſtract each Diſtance from the following, for the firſt Difference, and prefix the Sign —, if the Diſtances decreaſe. Subſtract each firſt Difference thus found from the following One of the ſame Order, for the ſecond Difference: And in like Manner ſubſtract the Firſt ſecond Difference from the following for the third Difference; applying the Signs as in algebraic Subſtraction. Denote the firſt or laſt firſt Difference by b; the firſt or laſt ſecond Difference by c, according as the Interpolation to be made is for the firſt or laſt 12 Hours; denote alſo the third Difference by d, and, a being put to ſignify the Diſtance at the Beginning of the Interval, the interpolated Diſtances will be as follows:

At IIId Hour of firſt Interval $a + \frac{1}{4}b - \frac{3}{32}c + \frac{7}{128}d$
At VIth Hour of firſt Interval $a + \frac{1}{2}b - \frac{1}{8}c + \frac{1}{16}d$
At IXth Hour of firſt Interval $a + \frac{3}{4}b - \frac{3}{32}c + \frac{5}{128}d$

Or,

At IIId Hour of laſt Interval $a + \frac{1}{4}b - \frac{3}{32}c - \frac{5}{128}d$
At VIth Hour of laſt Interval $a + \frac{1}{2}b - \frac{1}{8}c - \frac{1}{16}d$
At IXth Hour of laſt Interval $a + \frac{3}{4}b - \frac{3}{32}c - \frac{1}{128}d$

In adapting theſe Formulæ to Numbers, great Care muſt be taken about the right Application of the Signs. Thus if *b*, *c*, or *d* is Negative, apply the Number expreſſing the Value of that Term of the Formula where it is found with a contrary Sign to that of the Formula

Let me add in this Place, that if in filling up the firſt and laſt Intervals, a new ſecond Difference has been ſuppoſed in arithmetical Progreſſion with the Two given ones, in order to take a mean between it and the firſt or laſt ſecond Difference, the Interpolation at the Middle of the Interval or VIth Hour will be had true, the ſame as if the above Formulæ had been uſed: But at the Interpolation of the firſt and third Quarter there will be an Error of $_{T}\frac{1}{2\,5}$ third Difference; which will be corrected, by applying $+\ _{T}\frac{1}{2\,5}\,d$ or third Difference, to Number found at the firſt Quarter of the Interval, and $-\ _{,}\frac{1}{2\,T}\,d$ to that found at the third Quarter of the Interval; equally the ſame whether it be the firſt or laſt Interval.

The Configurations of Jupiter's Satellites, Page XIIth and laſt, exhibit the apparent Poſitions of the Satellites with reſpect to each other, and to Jupiter at ſuch an Hour of the Evening or Night as they are moſt likely to be obſerved, and ſerve to diſtinguiſh the Satellites from one another. Jupiter is diſtinguiſhed by the Mark ○, and the Satellites by Points with Figures annexed, the Figure 1 ſignifying the the firſt Satellite, 2 the ſecond Satellite, *&c.* When the Satellite is approaching towards Jupiter, the Figure is put between Jupiter and the Point; and when the Satellite is receding from Jupiter, the Figure is put on the other Side of the Point. The Satellites are in the ſuperior Parts of their Orbits, or furtheſt from the Earth, when they are marked to the right hand or Weſt of Jupiter approaching him; or to the left Hand or Eaſt of Jupiter receding from him; but are in the inferior Part of their Orbits, or neareſt to the Earth, when they are marked to the right Hand or Weſt of Jupiter receding from him, or to the left or Eaſt of Jupiter approaching him. The Cypher ○, ſometimes annexed to the Figure of the Satellite towards the Margin, ſignifies, that it is inviſible on the Face of Jupiter; and the black Mark ●, ſignifies that it is inviſible, being eclipſed in Jupiter's Shadow, or, behind Jupiter eclipſed by his body.

THE END.

WORKS

PUBLISHED

BY THE COMMISSIONERS OF LONGITUDE,

AND

SOLD BY P. ELMSLY, IN THE *STRAND*.

I. THE NAUTICAL ALMANACS from 1767 to 1769, inclusive. *In Sheets, Price 3s. 6d.*

II. TABLES requisite to be used with the NAUTICAL ALMANAC. *1st Edit. Price 2s. 6d.*—1766.

III. The same. *2d Edit. enlarged and improved. Price 5s.* —

IV. PRINCIPLES of Mr. JOHN HARRISON'S WATCH, with PLATES of the same. *Price 5s.*—1767.

V. An ACCOUNT of the Going of Mr. JOHN HARRISON'S WATCH at the ROYAL OBSERVATORY. *Price 2s. 6d.*—1767

VI. THEORIA LUNÆ JUXTA SYSTEMA NEWTONIANUM, AUCTORE TOBIA MAYER. *Price 2s. 6d.*—1767.

VII. The METHOD of Constructing MURAL QUADADRANTS, exemplified by a Description of the BRASS MURAL QUADRANT, in the ROYAL OBSERVATORY at *Greenwich*: To which is added, The METHOD of dividing Astronomical Instruments. By Mr. JOHN BIRD, Mathematical-Instrument-Maker. *Price 2s. 6d.*—1768.

VIII. TABULÆ MOTUUM SOLIS ET LUNÆ NOVÆ ET CORRECTÆ, AUCTORE TOBIA MAYER: Or NEW AND CORRECT TABLES OF THE MOTIONS OF THE SUN and MOON. By TOBIAS MAYER. *Price 5s.* — 1770.

IX. GENERAL TABLES for correcting the Apparent Distance of the Moon and a STAR or the Sun from the Effects of Refraction and Parallax, in 276 Sheets in Folio. *In Sheets, Price 21s.* — 1772.

*** *This Book is not perfect without Six Pages of Errata in the Reductions.*

X. ASTRONOMICAL OBSERVATIONS made in a *Voyage* towards the *South Pole* and round the *World* in His MAJESTY's *Ships*, the *Reſolution* and *Adventure*, in 1772, 1773, 1774 and 1775 by WILLIAM WALES, F. R. S. Maſter of the Royal Mathematical School in Chriſt's Hoſpital, and Mr. WILLIAM BAYLY, late Aſſiſtant at the Royal Obſervatory,
Price 21*s.*—1777.

XI. DESCRIPTION of an Engine for dividing Circles and Arches of Circles on Mathematical Inſtruments, accompanied with Plates By Mr. J. RAMSDEN, Mathematical-Inſtrument-Maker and Optician. *Price* 5*s.*—1777.

XII. DESCRIPTION of an Engine for dividing Strait Lines on Mathematical Inſtruments, accompanied with Plates. By Mr. J. RAMSDEN, Mathematical-Inſtrument-Maker and Optician.
Price 5*s.*—1779.

XIII. A SEXCENTENARY TABLE, exhibiting at Sight the Reſult of any Proportion where the Terms do not exceed 600 Seconds or 10 Minutes, By J. BERNOULLI, Aſtronomer to His *Pruſſian* MAJESTY. *In Sheets*, *Price* 5*s.*—1779.

XIV. A SEXAGESIMAL TABLE, exhibiting at Sight the Reſult of any Proportion where the Terms do not exceed 60 Minutes; and a MILLESIMAL TABLE of proportional Parts, with other uſeful Tables, By MICHAEL TAYLOR,
In Sheets, *Price* 15*s.*—1780.

XV. TABLES of the Products and Powers of Numbers. By CHARLES HUTTON, LL. D. and F. R. S. *Price* 7*s.*6*d.*—1781.

XVI. ASTRONOMICAL OBSERVATIONS made in a *Voyage* to the *Northern Pacific Ocean* for diſcovering a North Eaſt or North Weſt Paſſage, wherein the North Weſt Coaſt of America and North Eaſt Coaſt of Aſia were explored in His MAJESTY's *Ships* the *Reſolution* and *Diſcovery*, in 1776, 1777, 1778, 1779, and 1780, by Captain JAMES COOK, F. R. S, Lieutenant JAMES KING and Mr. WILLIAM BAYLY. *Price* 21*s.*—1782.

XII. GENERAL TABLES of the MOON's DISTANCE from the SUN and Ten principal FIXED STARS uſeful for finding the Longitude at Sea or Land.
In Boards, *Price* 5*s.* 6*d.*—1787.

XIII. *MAYER's* LUNAR TABLES improved. By Mr. CHARLES MASON *In Boards*, *Price* 5*s.* 6*d.*—1787.

WORKS, &c.

XIX. ASTRONOMICAL OBSERVATIONS made in *Voyages* undertaken by ORDER of His preſent MAJESTY for making Diſcoveries in the *ſouthern Hemiſphere* and ſucceſſively performed by Commodore BYRON, Captain WALLIS, Captain CARTERET and Captain COOK, in the *Dolphin*, *Tamer*, *Swallow* and *Endeavour*, in 1764, 1765, 1766, 1767, 1768, 1769, 1770 and 1771, extracted from the Journals of the Commanders and the Papers of Mr. CHARLES GREEN, formerly Aſſiſtant at the Royal Obſervatory, and put in order and computed by WILLIAM WALES, F. R. S. Maſter of the Royal Mathematical School in Chriſt's Hoſpital.

In Sheets, Price 10*s.* 6*d.*—1788.

N. B. To the NAUTICAL ALMANAC of 1769 are annexed, Inſtructions relative to the Obſervation of the Tranſit of Venus over the Sun's Diſk on June 3d, 1769, by the *Aſtronomer Royal.*

To the NAUTICAL ALMANAC of 1771 are added, Tables for finding the Latitude from Two obſerved Altitudes of the Sun, with the Interval of Time, meaſured by a Watch, by Admiral *Campbell*, F. R. S. and new Tables for computing the Eclipſes of Jupiter's Third Satellite, by the late Mr. *Wargentin*, F. R. S.

To the NAUTICAL ALMANAC of 1772 are annexed, Two Methods for clearing the apparent Diſtance of the Moon from the Sun or a fixed Star of the Effect of Refraction and Parallax, by the *Aſtronomer Royal* and the late Mr. *George Witchell*, F. R. S. and the Solution of a Problem in MERCATOR's NAVIGATION, by the late Mr. *Lyons*.

To the NAUTICAL ALMANAC of 1773 is added, A new Table of Equations to equal Altitudes, by Mr. *William Wales*, F. R. S. alſo, A Catalogue of the Places of 387 fixed Stars in right Aſcenſion, Declination, Longitude and Latitude, adapted to the Year 1760, with their Magnitudes and annual Variations in right Aſcenſion and Declination, calculated from the late Dr. *Bradley's* Obſervations.

To the NAUTICAL ALMANAC of 1774 are added, The Reſult of a Series of 10 Years Lunar Obſervations of Dr. *Bradley*, compared with a Set of manuſcript Tables; Elements of Lunar Tables and Remarks on the *Hadley's* Quadrant, by the *Aſtronomer Royal*; a Problem for finding the Error in the Poſition of a Tranſit Teleſcope, and Two Examples of the Calculation of the Longitude from a Lunar Obſervation, *&c.* by the late Mr. *Lyons*.

To the NAUTICAL ALMANAC of 1778 are added, Right Aſcenſions and Zenith Diſtances of the Moon, deduced from Dr. *Bradley's* Obſervations; and Aſtronomical Problems by the late Mr. *Lyons*.

To the NAUTICAL ALMANAC of 1779 are added, New Tables for computing the Eclipſes of Jupiter's ſecond Satellite, by the late Mr. *Wargentin*, F. R. S

WORKS, &c.

To the NAUTICAL ALMANAC of 1781 are added, Aſtronomical Problems, by the late Rev. *John Edwards*, B. A.

To the NAUTICAL ALMANAC of 1787 is added, A Treatiſe, containing Directions for making the beſt Compoſition for the Metals of Reflecting Teleſcopes, and the Method of caſting, grinding, poliſhing, and giving them the true parabolic Figure; and an Account of the Cauſe and Cure of the Tremors peculiarly affecting Reflecting Teleſcopes more than Refracting ones. By the late Rev. *John Edwards*, B. A. And Remarks on the ſaid Tremors by the *Aſtronomer Royal*.

To the NAUTICAL ALMANAC of 1788 is added, A Deſcription of an accurate and ſimple Method of adjuſting HADLEY's Quadrant for the back Obſervation. By *Robert Blair*, M. D.

To the NAUTICAL ALMANAC of 1791 are added, An Advertiſement of the expected Return of the Comet of 1532 and 1661 in 1788. By the *Aſtronomer Royal*.

An Advertiſement relative to the Diſappearances and Re-appearances of Saturn's Ring in 1789 and 1790. By the *Aſtronomer Royal*.

To the NAUTICAL ALMANACS of 1795 and 1796 are added, Tables to improve and render more general the Method of finding the Latitude from Two obſerved Altitudes of the Sun, with the Time between. By *John Brinkley*, A. M.

WHERE MAY BE HAD,

ASTRONOMICAL OBSERVATIONS

MADE AT

The ROYAL OBSERVATORY at GREENWICH,

By the Rev. NEVIL MASKELYNE, D.D. F.R.S.

And ASTRONOMER ROYAL,

In FOLIO.

VOL. I. from 1765 to 1774;

With TABLES

For Computing

The APPARENT PLACES of the FIXT STARS

And Reducing

OBSERVATIONS of the PLANETS,

By the SAME.

Price 25s. in Sheets.

VOL. II. from 1775 to 1786.

Price 30s. in Sheets.

Alſo, the OBSERVATIONS

MADE

In the YEARS 1787, 1788, 1789, 1790, 1791, and 1792.

Price 2s. 6d. for each Year, in Sheets.

PUBLISHED

By the PRESIDENT and COUNCIL of the ROYAL SOCIETY,

In OBEDIENCE to His MAJESTY's COMMAND.

This Day are publiſhed,

TABLES

OF

LOGARITHMS OF NUMBERS FROM 1 TO 101000,

AND OF THE SINES AND TANGENTS TO EVERY SECOND OF THE QUADRANT,

BY MICHAEL TAYLOR,

(AUTHOR OF THE SEXAGESIMAL TABLE,)

WITH PRECEPTS FOR THE USE OF THE SAME,

BY NEVIL MASKELYNE, F.R.S. ASTRONOMER ROYAL.

Price Three Guineas in Sheets to the Subscribers. Price Four Guineas in Sheets to Non-Subscribers.

LONDON:

SOLD AND DELIVERED BY

FRANCIS WINGRAVE,

BOOKSELLER IN THE *STRAND*;

Where Subſcribers to this Work, who have not received their Books, are deſired to pay forthwith the Second Half of their Subſcription Money, and take up their Books.

This Day are publiſhed,

MARGETTS's *LONGITUDE TABLES,*

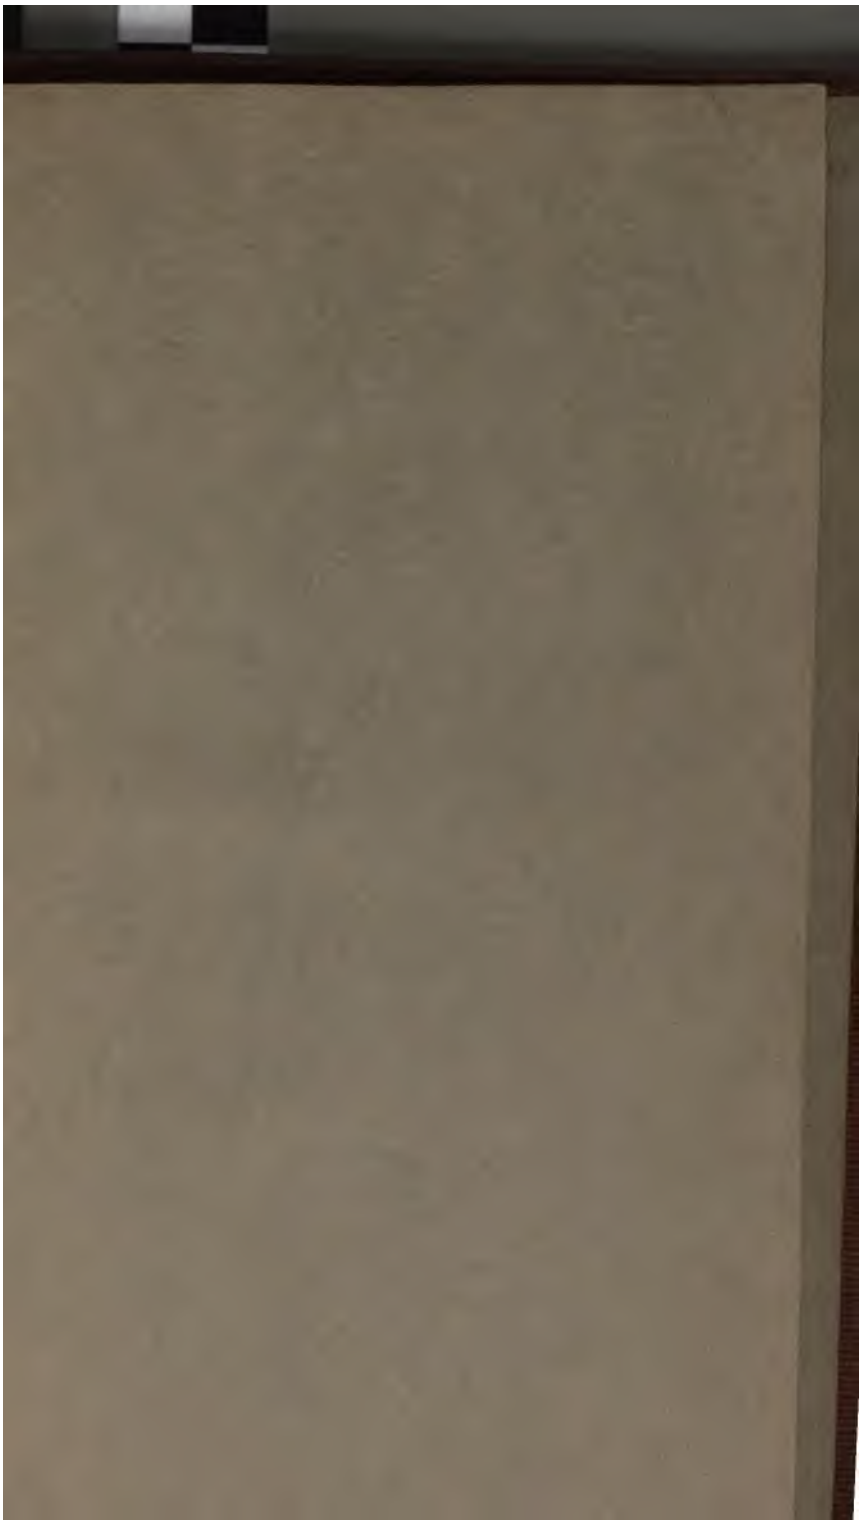
For Correcting the *Effect* of *Parallax* and *Refraction* on the *Diſtance* obſerved between the *Moon* and the *Sun* or a fixed *Star*, whereby the true Diſtance is eaſily and accurately obtained, and the Longitude from *Greenwich* found by Inſpection; together with *Horary Tables* by the ſame Author, for ſhewing the apparent Time by Inſpection, and alſo the Latitude of a Ship, and the Azimuth or Altitude of any celeſtial Object.

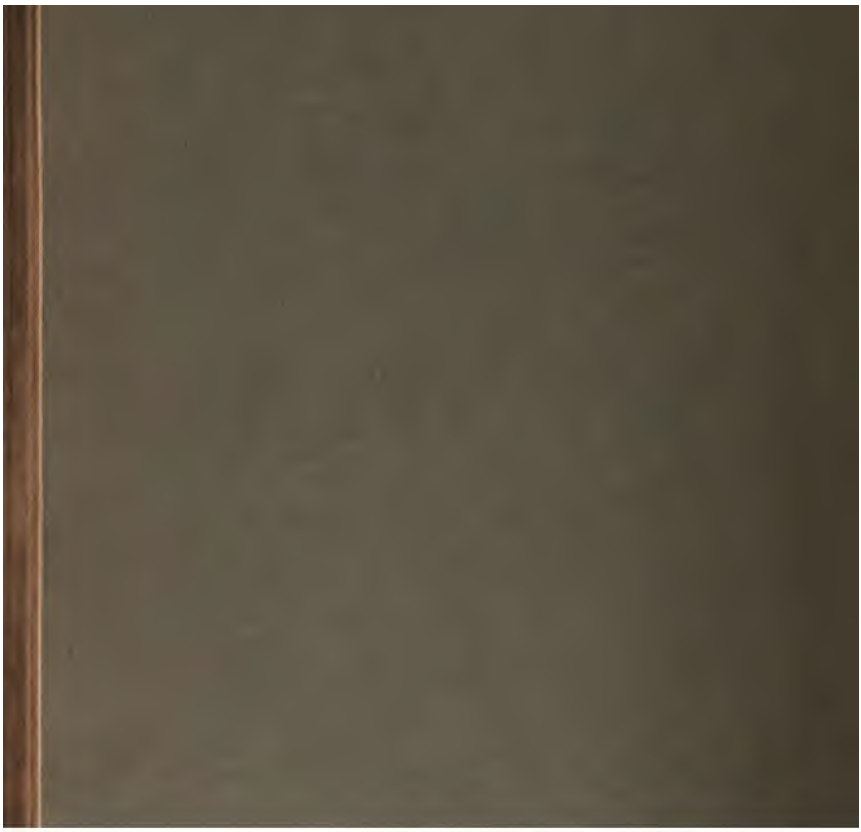
LONDON:

PRINTED FOR, AND SOLD BY THE AUTHOR,

N°. 21, *King Street, Cheapside, or at the Jeruſalem Coffee-Houſe, Cornhill.*

The Price of the whole Work bound together is Five Guineas; or either of the Two Parts may be had ſeparately, at Three Guineas.





OCT 1- 1928
